

# HISTORIC ENVIRONMENTAL APPROVAL GRANTED FOR HUALILÁN GOLD PROJECT

## **Highlights**

- Environmental Impact Assessment ("EIA") approved for the Hualilán Gold Project
- First gold project in San Juan Province to receive EIA approval in 17 years
- Approval enables commencement of mine construction and development
- Demonstrates Challenger's commitment to environmental and social responsibility

**Challenger Gold (ASX: CEL)** ("**CEL**" or the "**Company**") is pleased to announce that it has received approval of the Environmental Impact Assessment ("EIA") for its Hualilán Gold Project in San Juan Province, Argentina, through Resolution No. 688-MM-2024.

The approval represents a major milestone in the development of the Hualilán Project and marks the first gold project in San Juan Province to receive an EIA approval in 17 years. The EIA covers 19 mining rights, including the Hualilán Groups No. 1 and No. 2, and enables the Company to proceed with mine construction and development activities.

The Company has made strong social commitments including:

- Prioritising local employment with focus on San Juan residents
- Community development program
- Technical training program for local students
- Promoting participation of local and regional suppliers

**Dr. Sonia Delgado, Executive Director of Challenger Gold commented:** "This approval establishes a new standard in mining, combining economic development with environmental protection and social benefit for San Juan. Challenger chose San Juan not by chance, but by conviction - a province that offers not only legal security and institutional support but possesses exceptional human capital and over a century of mining tradition."

"The approval process was led by local professionals, demonstrating that San Juan's talent meets the highest international standards. We will be an example of modern mining, with 71 specific environmental commitments that we view as our promise to the people of San Juan who have seen us grow."

The EIA approval enables the Company to advance with sectoral permits and commence construction activities at the Hualilán Project.

### HUALILAN GOLD PROJECT OPERATIONAL ADVANTAGES

The Hualilan Gold Project is located in San Juan province Argentina. It is one of the largest undeveloped high-grade gold projects in Argentina hosting a Mineral Resource Estimated ("MRE") of 2.8 Moz AuEq<sup>1</sup> that extends over 2.2 kilometres of strike. More than 75% of the 2.8Moz AuEq resource is in Indicated Category and the resource is based on approximately 220,000 metres of CEL drilling.

Hualilan has several operational advantages over most gold projects in Argentina. The project is located at an elevation of 800 masl and enjoys benign weather conditions all year round. The project is not impacted by Argentina's glacial or watercourse laws. The project has excellent infrastructure that includes access via a double lane sealed highway, and pre-existing energy and water infrastructure. Hualilan is only 1.5 hours by road from San Juan City, Argentina's main mining hub, which provides access to a deep pool of experienced mine workers and high-quality mining service providers.

The 2.8 Moz resource contains a high-grade core 9.9 Mt at 5.0 g/t AuEq (for 1.6 Moz AuEq) providing significant flexibility. The resource remains open in most directions with intersections outside the current resource including 13.0m at 15.5 g/t AuEq (600 metres south of the MRE) and 4.0m at 5.8 g/t AuEq (600 metres below the MRE with the hole ending in mineralisation). Challenger controls a district scale footprint of 600 square kilometres surrounding Hualilan that contains approximately 30 kilometres of untested strike. The project is located in an area with low environmental sensitivity and the Company has purchased the 20,000 Ha's surrounding the project with all mine infrastructure to be located on Challenger owned land.

The project has a strong social licence to operate in San Juan which has been driven by community engagement and an excellent operational track record including being the only mining company in Argentina to be certified carbon neutral over the past 2 years.

The Company released a Scoping Study in November 2023 based on the high-grade core of the deposit only that forecast (refer Hualilan Scoping Study Release to the ASX 8 Nov 2023):

- Average annual production target of 116,000 oz Au, 440,000 oz Ag, 9,175 t Zn
- Global lowest-quartile C1 cash cost of US\$527/oz (A\$811) and AISC of US\$830/oz
- Forecast EBITDA of US\$738m (A\$1.1 billion) over Life of Mine (LOM) at US\$1750 Au
- Rapid payback period of under 1.25 years at US\$1750 Au

### Previous announcements referred to in this release include:

The Mineral Resource Estimate for the Hualilan Gold Project was first announced to the ASX on 1 June 2022 and updated 29 March 2023 as well as the Scoping Study for the Hualilan project announced to the ASX on 8 November 2023. The Company confirms it is not aware of any information or assumptions that materially impacts the information included in that announcement and that the material assumptions and technical parameters underpinning the Mineral Resource Estimate continue to apply and have not materially changed.

### **ADDITIONAL INFORMATION**

### **COMPETENT PERSON STATEMENT – EXPLORATION RESULTS AND MINERAL RESOURCES**

The information that relates to sampling techniques and data, exploration results, geological interpretation and Mineral Resource Estimate has been compiled Dr Stuart Munroe, BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results and Mineral Resources. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

### FORWARD LOOKING STATEMENTS

The announcement may contain certain forward-looking statements. Words 'anticipate', 'believe', 'expect', 'forecast', 'estimate', 'likely', 'intend', 'should', 'could', 'may', 'target', 'plan', 'potential' and other similar expressions are intended to identify forward-looking statements. Indication of, and guidance on, future costings, earnings and financial position and performance are also forward-looking statements.

Such forward looking statements are not guarantees of future performance, and involve known and unknown risks, uncertainties and other factors, many of which are beyond the control of Challenger Gold Ltd, its officers, employees, agents and associates, which may cause actual results to differ materially from those expressed of implied in such forward-looking statements. Actual results, performance, or outcomes may differ materially from any projections or forward-looking statements or the assumptions on which those statements are based.

You should not place any undue reliance on forward-looking statements and neither. Challenger nor its directors, officers, employees, servants or agents assume any responsibility to update such information. The stated Production Targets are based on the Company's current expectations of future results or events and should not be relied upon by investors when making investment decisions. Further evaluation work and appropriate studies are required to establish sufficient confidence that this target will be met.

Challenger Gold Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,520m shares 126.8m options 58m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Sergio Rotondo (Exec Chair) Mr Kris Knauer, MD and CEO Ms Sonia Delago (Exec Dir) Mr Fletcher Quinn, Chairman Mr Pini Althaus , Non Exec Director Mr Brett Hackett Non Exec Director

Financial numbers, unless stated as final, are provisional and subject to change when final grades, weight and pricing are agreed under the terms of the offtake agreement. Figures in this announcement may not sum due to rounding.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates in the relevant original market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

### HUALILAN GOLD PROJECT MRE AND SCOPING STUDY

All references to the Scoping Study and its outcomes in this announcement relate to the ASX Announcement of 8 November 2023 'Hualilan Gold Project Scoping Study'. Please refer to that announcement for full details and supporting documentation.

### Table 3: Hualilan Hold Project Mineral Resource Estimate (March 2023)

Note: Some rounding errors may be present

### <sup>1</sup> Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1900 Oz, Ag US\$24 Oz, Zn US\$4,000/t, Pb US\$2000/t
- Metallurgical recoveries are estimated to be Au (95%), Ag (91%), Zn (67%) Pb (58%) across all ore types (see JORC Table 1 Section 3 Metallurgical assumptions) based on metallurgical test work.
- The formula used: AuEq (g/t) = Au (g/t) + [Ag (g/t) x 0.012106] + [Zn (%) x 0.46204] + [Pb (%) x 0.19961]
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

Challenger Gold Limited ACN 123 591 382 ASX: CEL **Issued Capital** 1,520m shares 126.8m options 58m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Sergio Rotondo (Exec Chair) Mr Kris Knauer, MD and CEO Ms Sonia Delago (Exec Dir) Mr Fletcher Quinn, Chairman Mr Pini Althaus , Non Exec Director Mr Brett Hackett Non Exec Director

### **About Challenger Gold**

Challenger Gold Limited's (ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complementary gold/copper projects in South America with the Company's flagship Hualilan Gold Project in San Juan, Argentina containing resources of **2.8 million ounces gold equivalent**.

- 1. Hualilan Gold Project, located in San Juan Province Argentina, is a near term development opportunity. It has extensive drilling with over 150 historical and almost 900 CEL drill-holes. The Company has released a JORC 2012 Compliant resource of 2.8 Moz AuEq which remains open in most directions. This resource contains a high-grade core 9.9 Mt at 5.0 g/t AuEq for 1.6 Moz AuEq and 29.1Mt at 2.2 g/t AuEq for 2.4 Moz AuEq within the larger MRE of 60.6 Mt at 1.4 g/t AuEq for 2.8 Moz AuEq. The resource was based on approximately 220,000 metres of CEL drilling. Drill results have included 6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 67.7m @ 7.3 g/t Au, 5.7 g/t Ag, 0.6% Zn, and 63.3m @ 8.5 g/t Au, 7.6 g/t Ag, 2.8% Zn. This drilling intersected high-grade gold over 3.5 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. Recent drilling has demonstrated this high-grade skarn mineralisation is underlain by a significant intrusion-hosted gold system with intercepts including 209.0m at 1.0 g/t Au, 1.4 g/t Ag, 0.1% Zn and 110.5m at 2.5 g/t Au, 7.4 g/t Au, 0.90% Zn in intrusives. The Hualilan Scoping Study demonstrates production of 116,000 oz Au, 440,000 oz Ag, 9175t Zn (141,000 oz AuEq) at an ASIC of US\$830/oz over an initial 7 year mine life. CEL's current program will include a Pre-Feasibility Study, and regional exploration along the previously unexplored 30 kilometres of prospective stratigraphy.
- 2. El Guayabo Gold/Copper Project covers 35 sq kms in southern Ecuador and is located 5 kilometres along strike from the 20.5 million ounce Cangrejos Gold Project<sup>1</sup>. Prior to CEL the project was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections including 156m @ 2.6 g/t Au, 9.7 g/t Ag, 0.2% Cu and 112m @ 0.6 % Cu, 0.7 g/t Au, 14.7 g/t Ag were not followed up. CEL's maiden drilling program confirmed the discovery of a major Au-Cu-Ag-Mo gold system spanning several zones of significant scale. The Company has drilled thirteen regionally significant Au-soil anomalies with over 500 metres of mineralisation intersected at eight of these thirteen anomalies, confirming the potential for a major bulk gold system at El Guayabo. The Company reported a maiden 4.5 Moz gold equivalent MRE with mineralisation remaining open in all directions. This MRE is based on 34 drill holes, for 22,572 metres, from the Company's Phase 1 and 2 diamond core drill program at its 100% owned El Guayabo concession. The drilling has focussed on 3 of the 7 anomalies that have returned plus 500 metre drill intercepts. CEL has recently commenced an 8,000m drill program designed to allow the reporting of a maiden Mineral Resource Estimate on two additional anomalies in the Colorado V concession. At the completion of this program the company intends to initiate a strategic process to explore options to monetise, or spin-off, its Ecuador assets.

### Criteria JORC Code explanation

RC sub-samples over 1m intervals are collected at the drill site from a cyclone mounted on the drill rig. A duplicate RC sample is collected for every 25-30m drilled.

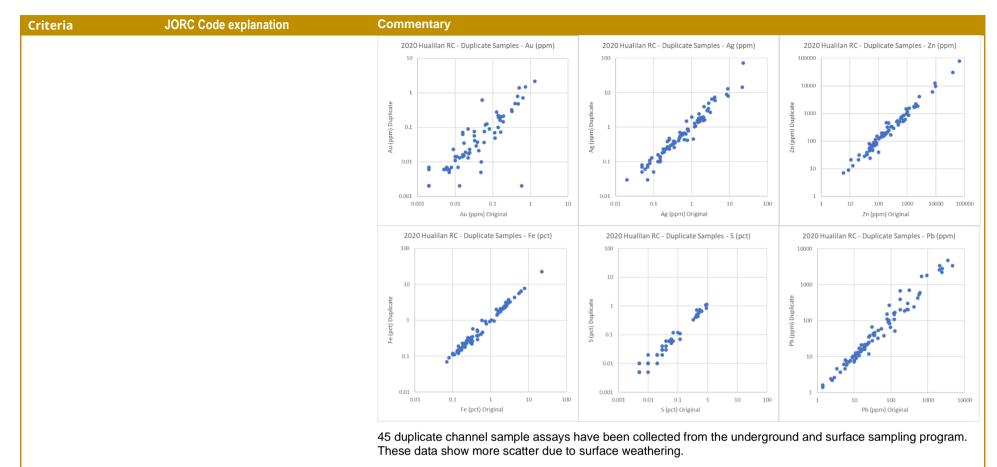

The duplicate RC sample results and correlation plots (log scale for Au, Ag, Zn, Pb, Fe and S) are shown below:

|             | count | RSQ   | m        | mean      |          | dian      | variance |           |  |

### Criteria JORC Code explanation

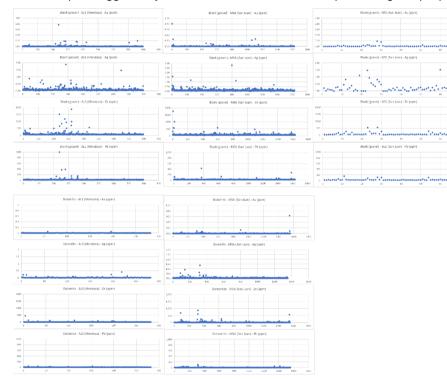

#### Commentary

considered partial or total.

- For geophysical tools spectrometers handheld XRF instruments etc the parameters used in determining the analysis including instrument make and model reading times calibrations factors applied and their derivation etc.
- Nature of quality control procedures adopted (eg standards blanks duplicates external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.

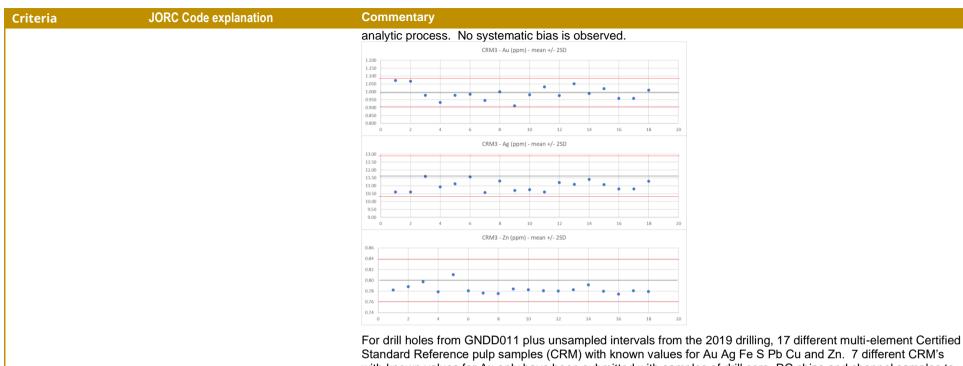

representatives due to COVID-19 restrictions. Each laboratory presents internal laboratory standards for each job to gauge precision and accuracy of assays reported.

CEL have used two different blank samples, submitted with drill core and subjected to the same preparation and assay as the core samples, RC sub-samples and channel samples. The blank samples are sourced from surface gravels in the Las Flores area of San Juan and from a commercial dolomite quarry near San Juan. In both cases the blank material is commonly for construction. Commonly, the blank samples are strategically placed in the sample sequence immediately after samples that were suspected of containing higher grade Au, Ag, S or base metals to test the lab preparation and contamination procedures. The values received from the blank samples suggest only rare cross contamination of samples during sample preparation.

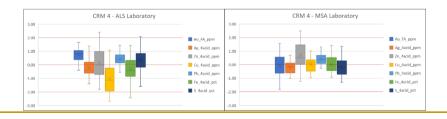

For GNDD001 – GNDD010 samples analysed by MSA in 2019, three different Certified Standard Reference pulp samples (CRM) with known values for Au Ag Pb Cu and Zn were submitted with samples of drill core to test the precision and accuracy of the analytic procedures MSA laboratory in Canada. 26 reference analyses were analysed in the samples submitted in 2019. The standards demonstrate suitable precision and accuracy of the

Standard Reference pulp samples (CRM) with known values for Au Ag Fe S Pb Cu and Zn. 7 different CRM's with known values for Au only have been submitted with samples of drill core, RC chips and channel samples to test the precision and accuracy of the analytic procedures of the MSA,ALS and SGS laboratories used. In the results received to date there has been no systematic bias is observed. The standards demonstrate suitable precision and accuracy of the analytic process. A summary of the standard deviations from the expected values for CRM's used is summarised below. Generally, an average of standard deviations close to zero indicates a high degree of accuracy and a low range of standard deviations with a low fail count indicates a high degree of precision.

Replicate assay of 140 pulp reject samples from the 2022 drill (parts of drill holes GNDD654 and GNDD666) was done to check assay precision. The original pulps were analysed by MSA laboratories (San Juan preparation and Vancouver, Canada analysis). Replicate pulps were analysed by ALS (Lima, Peru). The analytic techniques were identical at both laboratories.

|   |  | survey data with 0.1 meter precision is being acquired over the project to provide more detail where required.   |
| Data spacing and<br>distribution                              | <ul> <li>Data spacing for reporting of<br/>Exploration Results.</li> <li>Whether the data spacing and<br/>distribution is sufficient to<br/>establish the degree of geological<br/>and grade continuity appropriate<br/>for the Mineral Resource and Ore<br/>Reserve estimation procedure(s)<br/>and classifications applied.</li> <li>Whether sample compositing has<br/>been applied.</li> </ul>   | Nominal 80m x 80m, 40m x 80m and 40m x 40m drill spacing is being applied to the drilling to define mineralised<br>areas to Indicated Resource level of confidence, where appropriate. Drilling has been completed to check<br>previous exploration, extend mineralisation along strike, and provide some information to establish controls on<br>mineralization and exploration potential.<br>Samples have not been composited.   |
| Orientation of data<br>in relation to<br>geological structure | <ul> <li>Whether the orientation of<br/>sampling achieves unbiased<br/>sampling of possible structures<br/>and the extent to which this is<br/>known considering the deposit<br/>type.</li> <li>If the relationship between the<br/>drilling orientation and the<br/>orientation of key mineralised<br/>structures is considered to have<br/>introduced a sampling bias this<br/>should be assessed and reported<br/>if material.</li> </ul> | As far as is currently understood and where practicable, the orientation of sampling achieves unbiased sampling of structures and geology controlling the mineralisation. Some exploration holes have drilled at a low angle to mineralisation and have been followed up with drill holes in the opposite direction to define mineralised domains. For underground channel sampling, the orientation of the sample is determined by the orientation of the workings. Where the sampling is parallel with the strike of the mineralisation, plans showing the location of the sampling relative to the orientation of the mineralisation, weighted average grades and estimates of true thickness are provided to provide a balanced report of the mineralisation that has been sampled. Drilling has been designed to provide an unbiased sample of the geology and mineralisation targeted. In exceptional circumstances, where drill access is restricted, drilling may be non-optimally angled across the mineralised zone. |
| Sample security   | <ul> <li>The measures taken to ensure<br/>sample security.</li> </ul>  | Samples were under constant supervision by site security, senior technical personnel and courier contractors prior to delivery to the preparation laboratories in San Juan and Mendoza.  |
| Audits or reviews   | <ul> <li>The results of any audits or<br/>reviews of sampling techniques<br/>and data.</li> </ul>  | There has not yet been any independent reviews of the sampling techniques and data.  |

| Other substantive<br>exploration data | <ul> <li>Other exploration data if meaningful<br/>and material should be reported<br/>including (but not limited to):<br/>geological observations; geophysical<br/>survey results; geochemical survey<br/>results; bulk samples – size and<br/>method of treatment; metallurgical<br/>test results; bulk density groundwater<br/>geotechnical and rock characteristics;<br/>potential deleterious or contaminating<br/>substances.</li> </ul> | Specific gravity measurements have been taken from the drill core recovered during the drilling program. These data are used to estimate densities in Resource Estimates.<br>Eight Induced Polarisation (IP) lines have been completed in the northern areas of the Project. Stage 1 surveying was done on 1 kilometre length lines oriented 115° azimuth, spaced 100m apart with a 50m dipole. The initial results indicate possible extension of the mineralisation with depth. Stage 2 surveying was done across the entire field on $1 - 3$ kilometre length lines oriented 090°, spaced 400m apart with a 50m dipole. On-going data interpretation is being done as drilling proceeds. Three ground magnetic surveys and a drone magnetic survey have been completed. The results of these data and subsequent geological interpretations are being used to guide future exploration. Metallurgical test results are used to estimate the AuEq (gold equivalent) as detailed above in <i>Data Aggregation</i> and below in <i>Section 3: Metallurgical Factors or Assumptions</i> . The formula used for AuEq is: AuEq (g/t) = Au (g/t) + [Ag (g/t) x (24/1900) x (0.909/0.949)] + [Zn (%) x (40.00*31.1/1900) x (0.670/0.949)] + (Pb (%) x 20.00*31.1/1900) x (0.578/.9490}. Point resistivity surveys have been completed east of the Project for the purposes of detecting the presence of groundwater. Three surveys (total of 22 points) have been completed. A water bore has been drilled approximately 4 kilometres to the east of the Project which found water in permeable Quaternary sedimentary deposits above hard-rock basement at 128 metres vertical depth. Testing and |

### Section 3 Estimation and Reporting of Mineral Resources

### (Criteria listed in the preceding section also apply to this section.)

| Criteria                     | JORC Code explanation   | Commentary   |
|------------------------------|---|--|
| Database integrity           | <ul> <li>Measures taken to ensure that data has not<br/>been corrupted by for example transcription or<br/>keying errors between its initial collection and<br/>its use for Mineral Resource estimation<br/>purposes.</li> <li>Data validation procedures used.</li> </ul>  | Geological logging completed by previous explorers was done on paper copies and transcribed into a series of excel spreadsheets. These data have been checked for errors. Checks have been made against the original logs and with follow-up twin and close spaced drilling. Only some of the historic drill holes have been used in the Resource Estimate, including the results presented in Section 2. Some drill holes have been excluded where the geology indicates that the drill hole is likely mis-located or where the drill hole has been superseded by CEL drilling. For CEL drilled holes, assay data is received in digital format. Backup copies are backed up into a cloud-based file  |
|                              |   | storage system and the data is entered into a drill hole database which is also securely backed up off site.   |
| Site visits                  | - Comment on any site visits undertaken by the  | The drill hole data is backed up and is updated periodically by the CEL GIS and data management team.<br>The Competent Person has undertaken site visits during exploration. Site visits were undertaken in 2019 and 2020  |
| Site visits                  | Competent Person and the outcome of those   | before COVID-19 closed international travel. Post COVID numerous site visits have undertaken since November  |
|                              | visits.   | 2021. The performance of the drilling program, collection of data, sampling procedures, sample submission and  |
|                              | <ul> <li>If no site visits have been undertaken indicate<br/>why this is the case.</li> </ul>   | exploration program were initiated and reviewed during these visits.   |
| Geological<br>interpretation | <ul> <li>Confidence in (or conversely the uncertainty of)<br/>the geological interpretation of the mineral<br/>deposit.</li> <li>Nature of the data used and of any<br/>assumptions made.</li> <li>The effect if any of alternative interpretations<br/>on Mineral Resource estimation.</li> <li>The use of geology in guiding and controlling<br/>Mineral Resource estimation.</li> <li>The factors affecting continuity both of grade<br/>and geology.</li> </ul> | The geological interpretation is considered appropriate given the drill core density of data that has been collected, access to mineralisation at surface and underground exposures. Given the data, geological studies past and completed by CEL, the Competent Person has a high level of confidence in the geological model that has been user to constrain the mineralised domains. It is assumed that networks of fractures controlled by local geological factors have focussed hydrothermal fluids and been the site of mineralisation in both the prograde zinc skarn and retrograde mesothermal – epithermal stages of hydrothermal evolution. The interpretation captures the essential geometry of the mineralised structure and lithologies with drill data supporting the findings from the initial underground sampling activities. Mineralised domains have been built using explicit wireframe techniques from $0.2 - 0.5$ g/t AuEq mineralised intersections, joined between holes by the instruction from the geology and structure. Continuity of grade between drill holes is determined by the intensity of fracturing, the host rock contacts (particularly dacite – limestone contacts) and by bedding parallel faults, particularly within limestone, at the limestone and overlying sedimentary rock contact and within the lower sequences of the sedimentary rocks within 40m of the contact. No alternative interpretations have been made form which a Mineral Resource Estimate has been made. |
| Dimensions                   | - The extent and variability of the Mineral<br>Resource expressed as length (along strike or<br>otherwise) plan width and depth below surface<br>to the upper and lower limits of the Mineral   | 31 separate domains were interpreted over a strike length of 2.3kms. The domains vary in width and orientation from 2m up to 100m in width. The deepest interpreted domain extends from the surface down approximately 600m below surface.   |

| Criteria              | JORC Code explanation   | Commentary   |
|-----------------------|---|--|
|                       |   | All relevant variables; Au, Ag, Pb, Zn, Fe and S in each domain were estimated using Ordinary Kriging using only<br>data from within that domain. The orientation of the search ellipse and variogram model was controlled using<br>surfaces designed to reflect the local orientation of the mineralized structures.  |
|                       |   | An oriented "ellipsoid" search for each domain was used to select data for interpolation.<br>A 3 pass estimation search was conducted, with expanding search ellipsoid dimensions and decreasing minimum<br>number of samples with each successive pass. First passes were conducted with ellipsoid radii corresponding to<br>40% of the complete range of variogram structures for the variable being estimated. Pass 2 was conducted with<br>60% of the complete range of variogram structures for the variable being estimated. Pass 3 was conducted with<br>dimensions corresponding to 200% of the semi-variogram model ranges. Blocks within the model where Au was<br>not estimated during the first 3 passes were assigned as unclassified. Blocks for Ag, Pb, Zn, Fe and S that were not<br>estimated were assigned the average values on a per-domain basis. |
|                       |   | Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model grades for northings, eastings and elevation. These checks show good correlation between estimated block grades and drill sample grades.  |
| Moisture              | <ul> <li>Whether the tonnages are estimated on a dry<br/>basis or with natural moisture and the method<br/>of determination of the moisture content.</li> </ul> | Tonnage is estimated on a dry basis.   |
| Cut-off<br>parameters | <ul> <li>The basis of the adopted cut-off grade(s) or<br/>quality parameters applied.</li> </ul>  | The following metals and metal prices have been used to report gold grade equivalent (AuEq): Au US\$ 1900 / oz,<br>Ag US\$24 /oz, Zn US\$ 4,000 /t and Pb US 2,000/t.  |
| F                     |   | Average metallurgical recoveries for Au, Ag, Zn and Pb have been estimated from the results of Stage 1<br>metallurgical test work completed by SGS Metallurgical Operations in Lakefield, Ontario using a combination of<br>gravity and flotation combined metallurgical samples as detailed in the Criteria below.<br>For the AuEq calculation average metallurgical recovery is estimated as 94.9% for gold, 90.9% for silver, 67.0% for<br>Zn and 57.8% for Pb.<br>Accordingly, the formula used for Au Equivalent is: AuEq (g/t) = Au (g/t) + [Ag (g/t) x (24/1900) x (0.909/0.949)] +<br>[Zn (%) x (40.00*31.1/1900) x (0.670/0.949)] + (Pb (%) x 20.00*31.1/1900) x (0.578/.9490).   |
|                       |   | Based on the break-even grade for an optimised pit shell for gold equivalent, a AuEq cut-off grade of 0.30 ppm is used to report the resource within an optimised pit shell run at a gold price of US\$1,800 per ounce and allowing for Ag, Zn and Pb credits. Under this scenario, blocks with a grade above the 0.30 g/t Au Eq cut off are considered to have reasonable prospects of mining by open pit methods.<br>A AuEq cut-off grade of 1.0 ppm was used to report the resource beneath the optimised pit shell run as these  |
|                       |   | blocks are considered to have reasonable prospects of future mining by underground methods.  |

### Criteria JORC Code explanation

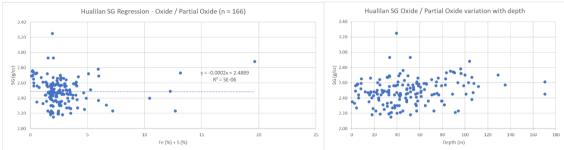

### Commentary

the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples.

- The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit.
- Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.

Within the mineralised domains there are 956 SG measurements made on drill core samples of 0.1 - 0.2 metres length. Measurements we determined on a dry basis by measuring the difference in sample weight in water and weight in air. For porous samples, the weight in water was measured after wrapping the sample so that no water enters the void space during weighing.

In oxidised and partially oxidised rocks, SG clusters around an average of 2.49 g/cc (2,490 kg/m3) which is independent of depth. A density of 2,490 kg/m3 has been used for oxidised, fracture oxidised and partially oxidised blocks.

In fresh rock samples, a regression model for block density determination has been made by plotting assay interval Fe (%) + S (%) from the interval where the SG measurement was made against the SG measurement. Fe and S are the two elements that form pyrite which is the mineral that is commonly associated with gold and base metal mineralisation at Hualilan. SG plotted against (Fe+S) follows a linear trend within the mineralised domains for oxide and fresh rock as shown below.

|---|--|---|
| Discussion of<br>relative accuracy/<br>confidence | <ul> <li>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</li> <li>The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</li> <li>These statements of relative accuracy and confidence of with production data where available.</li> </ul> | <ul> <li>There is sufficient confidence in the data quality drilling methods and analytical results that they can be relied upon. The available geology and assay data correlate well. The approach and procedure is deemed appropriate given the confidence limits. The main factors which could affect relative accuracy are: <ul> <li>domain boundary assumptions</li> <li>orientation</li> <li>grade continuity</li> <li>top cut.</li> </ul> </li> <li>Grade continuity is variable in nature in this style of deposit and has not been demonstrated to date and closer spaced drilling is required to improve the understanding of the grade continuity in both strike and dip directions. It is noted that the results from the twinning of three holes by La Mancha are encouraging in terms of grade repeatability.</li> <li>The deposit contains very high grades and there is need for the use of top cuts.</li> <li>No production data is available for comparison.</li> </ul> |
