

## UPDATED MINERAL RESOURCE ESTIMATE FOR GARDEN GULLY GOLD PROJECT

### HIGHLIGHTS

- The global **Garden Gully Gold Project** Mineral Resource Estimate (MRE) has increased by **47%**, expanding to a total remaining resource of **4.42 Mt at 2.5 g/t Au for 359,000 ounces** of contained gold.
- This represents a **29% increase** over the November 2024 estimate, or a **47% total increase** when including full, reconciled production mining up to April 1, 2026.
- Combined **Measured and Indicated** categories account for **71%** of the global project ounces, ensuring excellent local grade predictability for near-term mine planning.

| Deposit                                        | Cut Off | Tonnes           | Grade (g/t Au) | Contained Gold (Oz) |
|------------------------------------------------|---------|------------------|----------------|---------------------|
| Crown Prince OP*                               | 0.5g/t  | 712,000          | 3.4            | 78,000              |
| Crown Prince UG                                | 1.2g/t  | 1,453,000        | 3.2            | 150,400             |
| Cloudkicker                                    | 0.5g/t  | 499,000          | 1.9            | 31,300              |
| Lydia                                          | 0.5g/t  | 961,000          | 1.8            | 55,100              |
| Abbotts                                        | 0.5g/t  | 789,000          | 1.8            | 44,500              |
| <b>TOTAL In-situ April 1, 2026</b>             |         | <b>4,415,000</b> | <b>2.5</b>     | <b>359,300</b>      |
| Crown Prince Depleted resource to April 1 2026 | 0.5g/t  | 520,000          | 3.0            | 49,800              |
| <b>TOTAL Resource In situ and Depleted</b>     |         | <b>4,935,000</b> | <b>2.6</b>     | <b>409,100</b>      |

\*Tonnes are reported In-situ only. Depleted to April 1, 2026 mined surface. Total resource with variable cut-off grade, OP 0.5 g/t and UG 1.2 g/t Au, see detail below. Rounding error may occur.

- Crown Prince
  - Open Pit (OP) Measured Resource component of **39 koz at 3.83 g/t Au**, providing immediate, low-risk mill feed.
  - MRE beyond optimised pit shell estimated as Underground (UG) component at 1.2 g/t Au cut-off.
- Cloudkicker adds **31 koz** to global inventory with **80% classified as indicated** (yielding **25koz at 2.3 g/t Au**).
- Lydia (Maiden MRE) 55koz at 1.78 g/t Au.
- Abbotts (Maiden MRE) 44koz at 1.75 g/t Au.
- The **Cloudkicker** and **Lydia** deposits are located within **800 m** of the active Crown Prince hub. This immediate proximity allows both satellite assets to directly leverage existing haul roads, established site facilities, and current operational personnel—enabling rapid, low-capital development with zero infrastructure drag.

## Summary

New Murchison Gold Limited (**ASX: NMG**) (“NMG” or “the Company”) is pleased to announce a significant, JORC-compliant update to the Mineral Resource Estimate (MRE) at its flagship **Garden Gully Gold Project**, located near Meekatharra, Western Australia.

*Table 1: Garden Gully Gold Project MRE summary May 2026. Tonnes reported as In-situ only.*

| Deposit         | Mineral Resource | Cut Off       | Tonnes           | Grade (g/t AU) | Contained Gold (Oz) |
|-----------------|------------------|---------------|------------------|----------------|---------------------|
| Crown Prince OP | Measured         | 0.5g/t        | 316,000          | 3.8            | 38,900              |
|                 | Indicated        | 0.5g/t        | 382,000          | 3.1            | 38,700              |
|                 | Inferred         | 0.5g/t        | 13,000           | 0.9            | 400                 |
|                 | <b>Total</b>     | <b>0.5g/t</b> | <b>712,000</b>   | <b>3.4</b>     | <b>78,000</b>       |
| Crown Prince UG | Measured         | 1.2g/t        | 12,000           | 3.3            | 1,300               |

|                 | Inferred         |               | 1,808,000        | 1.7            | 101,100             |
|                 | <b>Total</b>     |               | <b>4,415,000</b> | <b>2.5</b>     | <b>359,300</b>      |

This update integrates the project's most advanced mineral assets, combining refined modelling from existing production areas with maiden resource inventories. Individual estimates were compiled by leading independent consultancies, incorporating NMG’s updated structural interpretations and latest drilling data:

- **Stokes Geoscience:** Updated estimates for the active **Crown Prince** operation and the **Cloudkicker** deposit, alongside the maiden MRE for **Lydia**.
- **Widenbar and Associates:** Compiled the maiden MRE for the **Abbotts** deposit.

By incorporating the Lydia and Abbotts assets for the first time, this global update significantly expands NMG's production pipeline and underscores the scaling potential of the Garden Gully goldfield.

When isolating the Crown Prince and Cloudkicker deposits—which comprised the entirety of the previous November 2024 model—the updated 2026 MRE achieved an 18% and 22% increase in contained gold ounces at the 1.2 g/t Au and 0.5 g/t Au cut-off grades respectively within the combined Measured and Indicated (M&I) resource classifications (Table 2). This significant resource upgrade demonstrates the high-value growth achieved across the core asset areas through recent targeted drilling.

*Table 2: Crown Prince and Cloud Kicker MRE comparison of Measured and Indicated resource between the 2024 and 2026 resource models.*

| Resource – Measured and Indicated | Cut Off | Tonnes      | Grade (g/t AU) | Contained Gold (Oz) |
|-----------------------------------|---------|-------------|----------------|---------------------|
| Total 2026 MRE*                   | 1.2g/t  | 2,067,000   | 4.0            | 266,200             |
| Total 2024 MRE                    | 1.2g/t  | 1,513,000   | 4.6            | 226,000             |

| Resource – Measured and Indicated | Cut Off | Tonnes      | Grade (g/t AU) | Contained Gold (Oz) |
| Total 2026 MRE*                   | 0.5g/t  | 3,580,000   | 2.7            | 306,500             |
| Total 2024 MRE                    | 0.5g/t  | 2,504,000   | 3.1            | 252,100             |
| <b>Difference</b>                 |         | <b>143%</b> | <b>85%</b>     | <b>122%</b>         |

*\*2026 MRE figures are exclusively comprised of Crown Prince and Cloudkicker*

Since 2024 Crown Prince MRE the exploration and mining teams have followed up on infill and extensional targets and carried out tighter spaced grade control campaigns to increase resource confidence. As shown in Table 3, since the 2024 MRE, 738 holes have been drilled and the new drilling has led to expanded and improved geological model.

Cloudkicker was first drilled in 2013-2014 and then returned to in 2020-2024, under NMG, to develop geological interpretations and define extents.

Lydia has undergone multiple phases of exploratory and definition drilling since acquisition by NMG in 2016. Drilling has delineated mineralisation and extended known depth and along strike of main structure.

Abbotts has remained undeveloped beyond historical small scale mining period of 1897-1908. Exploration was carried out by multiple entities 1973-2020 until NMG 2020-2026.

The prospects of Garden Gully located on the Abbotts Greenstone Belt (AGB) share the same setting and structural controls on mineralisation. Mineralisation is hosted within quartz-carbonate veins within altered and sheared mafic units. Primary mineralisation is not closed out along strike or depth.

*Table 3: Total number of holes drilled for MRE 2026.*

| Deposit      | DD        | RC         | RAB      | AU       |
|--------------|-----------|------------|----------|----------|
| Crown Prince | 34        | 590        | 4        | 9        |

| <b>Total</b> | <b>44</b> | <b>681</b> | <b>4</b> | <b>9</b> |

Figure 1: Garden Gully Regional Position

## Material information summary – Mineral Resources

Information required by ASX Listing Rule 5.8.1 (summary of technical information pertaining to the Mineral Resource Estimate) is detailed in the following sections.

## Geology and Geological Interpretation

The Garden Gully Gold Project, is located within the eastern flank of the Abbots Greenstone Belt of the northern Murchison Terrane of the Yilgarn Craton in Western Australia. While sitting in a separate belt, the deposit occupies a strategic position close to the highly prospective Wydgee-Meekatharra greenstone belt between the Paddy's Flat area to the south-east and the Andy Well gold mine to the north-east.

The Abbots Greenstone Belt comprises Archaean rocks of the Meekatharra and Greensleeves Formations (formerly Gabanintha Fm). These formations comprise a bimodal succession of komatiitic volcanic mafics and ultramafics overlain by felsic volcanics and volcanoclastic sediments, black shales and siltstones and interlayered with mafic to ultramafic sills. Within the project tenement area, the regional stratigraphy is folded into a south-plunging syncline. Regional synclinal succession trends N-NE with a northern fold closure. A postdating E-W synform is further transected by NE trending shear zones and EW trending Proterozoic dykes.

The belt is, in places, blanketed by broad alluvial flats, occasional lateritic duricrust and drainage channels braiding into the regional drainage system.

All relevant drill hole details were released in previous NMG ASX announcements between December 2017 and April 2026.

### Crown Prince

Drilling at the Crown Prince deposit confirms the presence of high-grade gold mineralisation in what are interpreted to be steep plunging shoots. Extensive primary gold mineralisation was also intercepted below the base of oxidation; primary mineralisation associated with sulphides, mainly pyrite and arsenopyrite, which offers a very positive outlook for potential deep mineralisation, which is to be further tested in follow-up drilling. The Crown Prince deposit is a structurally controlled, orogenic type and is hosted by more competent doleritic rocks above a strongly deformed and ductile ultramafic package and as stockwork veins. Occasional black shale units which have been metamorphosed to graphitic schists are located along N-S shear zones in the Crown Prince area. These are orientated at a high angle to the gold lodes and intersect mineralisation in very few locations. The regional foliation and structure that generally trends NNE is locally folded and contorted in the Crown Prince area. The lodes show variable dips and strike due to this folding. The folded gold mineralised veins are also interpreted to be offset by a later remobilisation of movement along a NNE trending shear.

Mineralisation is predominantly recognized on three main zones. The MZ, the NZ and the SEZ.

MZ strikes WNW and dips SW at approximately 70°. Historically the vein was followed for 40m strike length

MZ strikes WNW/SSE and dips to the SSW at 70° and adjacent sub parallel zones striking and dipping at about similar angles. The gold mineralisation was explored and stoped along a strike of up to 60 m over 4 levels

SEZ was discovered in 2022, it strikes north easterly along at least 200m length and displays similar characteristics with the other two mineralised zones (MZ and NZ).

### Cloudkicker

Cloudkicker is adjacent and analogous to the Crown Prince deposit in orientation and mineralisation style with mineralisation being concentrated within three main areas: Caprock, Steep Lodes and the Shallow Lodes. The Caprock sits at surface and occurs as supergene enriched mineralisation covering the footprint of the underlying ore. The Steep and Shallow Lodes display similar lithological and mineralogical characteristics and consist of gold-mineralised quartz-carbonate veins within strongly sheared and folded

mafic schists hosted within a dominant doleritic unit. The Steep and Shallow Lodes are modelled on two orientations which cross cut, very strong mineralisation seen at some intersections.

## Lydia

Mineralisation at Lydia is comparable to the Crown Prince deposit and is concentrated within three main areas: Steep Lodes, Shallow Lodes and Lydia South. All display similar lithological and mineralogical characteristics and consist of gold-mineralised quartz-carbonate veins within strongly sheared and folded mafic schists hosted within a dominant doleritic unit.

## Abbotts

Mineralisation at Abbotts is concentrated on a north-south shear zone along the strike of historical mines Mt Vranizan and New Murchison King. The main ore zone is hosted by quartz veins less than 0.5m wide, sub-parallel to the schistosity of argillaceous and felsic tuff intruded by felspar porphyry and dolerite over a strike of approximately 1200 metres. Mineralisation is structurally controlled and favours a position at or around the contacts of the dacite intrusion.

## Sampling and Sub-Sampling techniques

No rotary air blast (RAB) or air core (AC) holes were used in the Mineral Resource Estimate.

NMG era drilling:

RC samples were collected and split into even 1m intervals where samples were dry. Wet samples were speared, or on occasion sampled by scooping. RC drill chips from each metre were examined visually and logged by the geologist. 4m composites of these samples were then collected by field staff where visual inspection showed the rock to be apparently unmineralised; 1m intervals were sampled where visually interesting intervals of alteration or mineralisation were encountered. Intervals of interest were also evaluated by hand-held XRF, where the elevated metal content (typically arsenic) was used to assess the mineralisation of the samples. Where 4m composites returned assays greater than 0.1g/t Au, the 1m interval samples were sent for assay.

HQ Diamond core was examined visually and logged by the geologist. Where selected, core was generally sampled at 1m intervals, unless visual observations warranted narrower intervals, with a minimum of 0.3m. Core was marked up and cut into half core for sampling and quarter core for duplicates using a diamond blade saw. Visual observation of alteration/mineralisation was noted on the drill logs.

Sampling of DDH core and RC chips follows NMG's protocols and QAQC procedures.

## Drilling Techniques

NMG era drilling:

Reverse Circulation (RC) drilling was undertaken with a hammer diameter of 5.5" (130mm) using either a truck mounted 660/700 drill rig with a 1350cfm/500psi onboard compressor or (for narrow holes) a multi-purpose scout drill rig mounted on a 4x4 with a 600cfm auxiliary booster.

Diamond holes were drilled with HQ size (63.5mm diameter) rods. Triple tube coring was used to maximise core recovery. Core was orientated using NQ REFLEX Ori tools. Hole attitude when surveyed used Champ gyro.

## Historical Drilling Techniques

The prospects Crown Prince, Cloudkicker, Lydia and Abbotts have historical drilling dating back to the early 1980's, methods include Aircore (AC), Auger (AU), Rotary Air Blast (RAB), Reverse Circulation (RC),

Reverse Circulation with Diamond Tail (RCDD) and Diamond Drilling (DD). The MRE for these deposits only used Diamond Drilling or Reverse Circulation drilling results (including RCDD). The Reverse Circulation Drilling was completed with a hammer diameter of 5.5" (130mm) while the Diamond Drilling was drilled with NQ2 size rods.

## Sample Analysis Method

Samples were analysed at Intertek Laboratories using a 50g fire assay (FA) technique. Samples were pulverised to a nominal 85% passing 75 microns. Gold analysis was undertaken using Au-AA26 involving 50g lead collection fire assay and Atomic Adsorption Spectrometry (AAS) finish. QAQC procedures included insertion of field blanks, certified standards and duplicates samples to evaluate analysis performance. The QAQC data indicates that results are of a suitable standard for mineral resource estimation.

## Historical Analyses

Samples from the 2003 to 2004 programs were assayed by SGS Analabs in Mt. Magnet and Perth, and the entire 1 kg to 2 kg sample was pulverized to 90% passing 75 µm and a 50 g split was taken for fire assay analysis.

## Bulk Density

For Crown Prince, Cloudkicker and Lydia, Bulk Density (BD) determination was done on a small selection of core samples from different lithologies and weathering types from the DD programs in 2000 and 2004, and more recently in 2023 and 2024. Sub domained zones were assigned values based on the BD determinations. More sampling of material from selected zones is required to provide additional confidence for future estimations. However, it is considered that there is sufficient and reliable data to assign dry bulk densities for resource estimation.

## Estimation Methodology

### Crown Prince, Cloudkicker and Lydia

Block models were constructed for each deposit to constrain estimation to each resource area.

Mineralisation wireframes were generated in Leapfrog Geo 2025.3, based on geological logging and assay data. For all domains samples were composited to intervals based on assessment of the raw input sample statistics (4m for domain 51000 and 1m for all other domains). Assay composite data was analysed geostatistically in Leapfrog Edge to identify the population statistics and appropriate top cut (applied as a cap to the assay grades). A normal scores transform was used to de-skew the data for analysis of grade continuity using variogram analysis. Variograms were generated for each domain where sufficient data would allow and orientation and ranges were used to constrain the Interpolation parameters.

The mineralisation has generally been extrapolated to one times the nominal drill pattern, which is approximately 20m in most cases. The Block Model was generated in Leapfrog Edge and included a range of attributes including oxidation state, bulk density, mining depletion, mineralised domain codes, resource classification and estimation data as well as an estimated gold grade. Parent blocks of 5 m(E) by 5 m(N) by 2.5 m(RL) have been used, with sub-celling to 0.625m by 0.625m by 0.625m to follow mineralisation boundaries. The block model estimates were generated using ordinary kriging to estimate gold content and variability. Most domains were estimated with three passes with the pass ranges and min/max number of samples optimised to allow for an accurate global estimate that minimises localised over-smoothing.

Figure 4: Crown Prince OP MRE - shown with a 0.5gt cutoff and pit shell. Crown Prince UG MRE - shown with a 1.2gt cutoff and pit shell.

Figure 5: Cloudkicker and Lydia OP MRE - shown with a 0.5gt cutoff and pit shell.

## Abbotts

Statistical analysis and variography was carried out on the mineralised one metre composited drillhole data to generate top cut values and kriging parameters. Top cuts were 40 g/t Au for New Murchison King and 7 g/t Au for Mt Vranizan. Grade estimation was carried out on drillhole data using the Ordinary Kriging functionality in Micromine 2026.3 software. Parent blocks of 2 m(E) by 5 m(N) by 5 m(RL) have been used, with sub-celling to 1m by 1m by 1m to follow mineralisation boundaries. Estimation was carried out for gold only. An Indicator Mineralisation Model was used to define a 'mineralised envelope', which was used to control modelling. A dynamic search ellipse was used to honour strike and dip variations. The resource

model was generated using an Ordinary Kriging interpolation method, with a multi-pass search approach. The first search ellipsoid had dimensions of 25m x 25m x 5m with a minimum of 8 samples and a maximum of 16. The second search, used where not enough data was found in the first search had dimensions 50m x 50m x 7m, with a third pass at 100m x 100m x 9m to completely populate the mineralised blocks.

Figure 6: Abbots OP MRE - shown with a 0.5gt cutoff and pit shell.

## Mineral Resource Classification Criteria

Classification of the Mineral Resource Estimate is based on the degree of confidence in the geological model and data density. The competent person also reviewed the number of passes taken to fill the blocks, the average distance to the nearest sample, slope of regression and the Kriging efficiency, these were all considered in the classification process. Blocks lacking data or requiring excessive extrapolation have been excluded from classification and assigned unclassified.

## Crown Prince, Cloudkicker and Lydia

Crown Prince, Cloudkicker and Lydia have been classified inferred, indicated and measured considering all criteria. Drilling since 2024 has assisted in improving geological understanding and data density leading to upgrades of material from inferred to indicated and indicated to measured from earlier estimates.

Figure 7: Crown Prince OP MRE – showing a 0.5gt cutoff, Resource Classification and pit shell. Crown Prince UG MRE – 1.2gt cutoff, Resource Classification and pit shell.

Figure 8: Cloudkicker and Lydia OP MRE - showing a 0.5gt cutoff, Resource Classification and pit shell.

## Abbotts

Abbotts has a moderate understanding of geologic continuity and lacks detailed QAQC data, as such it has been classified as inferred.

Figure 9: Abbott OP MRE with 0.5gt cutoff, Resource Classification.

## Gold Cut-off Grades

All deposits where Open Pit (OP) mining is anticipated have applied a 0.5 g/t gold cut-off, in line with Open Pit mining practice and considering processing costs, recoveries and gold price.

A 1.2 g/t gold cut-off was selected for the Crown Prince Under Ground (UG) component of the resource, in line with Under Ground mining practice and considering processing costs, recoveries and gold price.

## Mining and Metallurgical Methods and Parameters

Crown Prince OP is in active production, nearing completion of stage 1. Estimations have adopted current practice of conventional open pit mining method using backhoe excavators and rigid dump trucks as the preferred mining method for all deposits outside of proposed Crown Prince UG.

Crown Prince UG will be mining using conventional long hole stoping, underground loaders and underground haul trucks.

Mined ore will be treated and processed at Westgold's Bluebird gold treatment plant.

Pit and stope (for Crown Prince UG) optimization analysis and feasibilities are being undertaken by NMG.

## Environmental Factors and Considerations

No considerations regarding environmental factors have been made as part of these MRE reports.

## Other Material Modifying Factors

No other material modifying factors were applied to the estimated block values.

## Next Steps

The company plans to use the MREs to underpin feasibility studies and optimization of OP and UG. Infill and extensional drilling to expand resource where still open and to improve classification categories.

## ABOUT NEW MURCHISON GOLD

New Murchison Gold Limited (ASX:NMG) is a mineral exploration and gold mining company which holds a substantial package of tenements in the prolific Murchison goldfield near Meekatharra, Western Australia.

The Company is focused on the Garden Gully Gold Project which comprises a 619km<sup>2</sup> tenure package covering the Abbotts Greenstone Belt and other key regional structures. The Company operates the Crown Prince Gold Mine and has multiple gold deposits along the belt.

Gold mineralisation in the belt is controlled by major north trending structures and contact zones between felsic and mafic metamorphosed rocks.

As announced 25 June 2025, the Company made a decision to develop the Crown Prince Gold Mine and completed its first blast on 30 June 2025. NMG commenced production in September 2025. NMG updated its Mineral Resource Estimate and Ore Reserve Estimate in December 2025.

## Disclaimer

This release may include forward-looking and aspirational statements. These statements are based on NMG management's expectations and beliefs concerning future events as of the time of the release of this announcement. Forward-looking and aspirational statements are necessarily subject to risks, uncertainties and other factors, some of which are outside the control of NMG, which could cause actual results to differ materially from such statements. NMG makes no undertaking to subsequently update or revise the forward looking or aspirational statements made in this release to reflect events or circumstances after the date of this release, except as required by applicable laws and the ASX Listing.

Refer to [www.newmurchgold.com.au](http://www.newmurchgold.com.au) for past ASX announcements.

## Competent Person's Statement

### Exploration Results

Information in this Announcement that relates to exploration results is based upon work undertaken by Mr. Costica Vieru, a Competent Person who is a Member of the Australian Institute of Geoscientists (AIG). Mr Vieru has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a 'Competent Person' as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (JORC Code). Mr Vieru is an employee of NMG Limited and consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

### Mineral Resources

The information contained in this announcement that relates to Mineral Resources for Crown Prince, Cloud Kicker and Lydia is based upon, and fairly represents, information and supporting documentation compiled by Mr Craig Stokes MAusIMM. Mr Stokes is a Principal Geologist with Stokes Geoscience with over 18 years in the mining industry and a Member of the Australasian Institute of Mining and Metallurgy. The Competent Person has sufficient experience relevant to the style(s) of mineralisation and type(s) of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Stokes consents to the inclusion of information relating to the Mineral Resource Estimate as it appears in this report.

The information contained in this announcement that relates to Mineral Resources for Abbots is based upon, and fairly represents, information and supporting documentation compiled by Mr Lynn Widenbar FAusIMM. Mr Widenbar is the Principal of Widenbar and Associates, a consultant resource geologist with over 50 years experience and a Member of the Australasian Institute of Mining and Metallurgy. The Competent Person has sufficient experience relevant to the style(s) of mineralisation and type(s) of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Widenbar consents to the inclusion of information relating to the Mineral Resource Estimate as it appears in this report.

The Competent Person for the Ore Reserve estimate is Mr Hemal Patel, a mining engineer with more than 18 years' experience in the mining industry. Mr Hemal is a Member of the AusIMM, a full-time employee of Has Holdings Pty Ltd and has sufficient open pit mining activity experience relevant to the style of mineralisation and type of deposit under consideration to qualify as a Competent Person as defined in the JORC Code. Mr Hemal consents to the inclusion of information relating to the Ore Reserve in the form and context in which it appears.

### Ore Reserves

Past Exploration results and Mineral Resource Estimates reported in this announcement were previously prepared and disclosed by NMG in accordance with JORC Code. The Company confirms that it is not aware of any new information or data that materially affects the information included in these market announcements. The Company confirms that the form and content in which the Competent Person's findings are presented here have not been materially modified from the original market announcement, and all material assumptions and technical parameters underpinning Mineral Resource Estimates in the relevant market announcement continue to apply and have not materially changed. Refer to [www.newmurch.com.au](http://www.newmurch.com.au) for details on past exploration results and Mineral Resource Estimates.

## APPENDIX 1: JORC CODE, 2012 EDITION – TABLE 1

Mr Stokes assumes responsibility for all matters relating to sections 1-3 of JORC Table 1 for the deposits Crown Prince, Cloudkicker and Lydia. Mr Widenbar assumes responsibility for all matters relating to related to sections 1-3 of JORC Table 1 for the deposit Abbotts.

| JORC Code Criteria and Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                            |               |             |                      |             |            |             |                            |             |                |             |     |             |     |           |              |              |               |    |   |       |    |     |     |         |     |    |     |          |        |      |   |       |    |     |   |       |     |           |     |          |        |           |              |              |               |    |  |  |  |     |    |         |     |    |    |         |       |      |  |  |  |     |  |  |  |           |    |          |       |           |              |              |               |    |   |       |    |     |     |         |       |    |     |          |        |      |   |       |    |     |   |       |     |       |     |          |        |

These examples should not be taken as limiting the broad meaning of sampling.</li><li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li><li>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to</li></ul> | <p><b>Abbotts</b></p> <p>The New Murchison King and Mt Vranizan deposits have been drilled over many years by various companies, as summarised below.</p> <p>Exploration Work</p> <table><tr><th>Period</th><th>Company</th></tr><tr><td>1973 - 1991</td><td>Esso, WMC, Endeavour</td></tr><tr><td>1991 - 2002</td><td>St Barbara</td></tr><tr><td>2002 - 2012</td><td>Mercator Gold, Silver Swan</td></tr><tr><td>2013 - 2019</td><td>Doray Minerals</td></tr><tr><td>2019 - 2020</td><td>NMG</td></tr><tr><td>2020 - 2024</td><td>NMG</td></tr></table> <div><div><p>New Murchison King</p><table><tr><th>Hole Type</th><th>No. of holes</th><th>Total Length</th><th>No. of Assays</th></tr><tr><td>DD</td><td>2</td><td>396.7</td><td>39</td></tr><tr><td>RAB</td><td>108</td><td>4,527.0</td><td>914</td></tr><tr><td>RC</td><td>270</td><td>23,560.0</td><td>10,358</td></tr><tr><td>RCDD</td><td>2</td><td>347.7</td><td>71</td></tr><tr><td>SRC</td><td>4</td><td>345.0</td><td>109</td></tr><tr><td>Sub Total</td><td>386</td><td>29,176.4</td><td>11,491</td></tr></table></div><div><p>Mt Vranizan</p><table><tr><th>Hole Type</th><th>No. of holes</th><th>Total Length</th><th>No. of Assays</th></tr><tr><td>DD</td><td></td><td></td><td></td></tr><tr><td>RAB</td><td>37</td><td>1,555.0</td><td>289</td></tr><tr><td>RC</td><td>60</td><td>5,057.0</td><td>2,808</td></tr><tr><td>RCDD</td><td></td><td></td><td></td></tr><tr><td>SRC</td><td></td><td></td><td></td></tr><tr><td>Sub Total</td><td>97</td><td>6,6607.0</td><td>3,097</td></tr></table></div><div><p>TOTAL</p><table><tr><th>Hole Type</th><th>No. of holes</th><th>Total Length</th><th>No. of Assays</th></tr><tr><td>DD</td><td>2</td><td>396.7</td><td>39</td></tr><tr><td>RAB</td><td>145</td><td>6,082.0</td><td>1,203</td></tr><tr><td>RC</td><td>330</td><td>28,617.0</td><td>13,166</td></tr><tr><td>RCDD</td><td>2</td><td>347.7</td><td>71</td></tr><tr><td>SRC</td><td>4</td><td>345.0</td><td>109</td></tr><tr><td>TOTAL</td><td>483</td><td>35,783.4</td><td>14,588</td></tr></table></div></div> <p>Reverse Circulation (RC) samples were collected via cyclone and riffle splitter. Samples were initially collected either as 4m, 5m or 6m composites in likely waste or as 1m samples in mineralised intersections. If the composites returned non-background grades, the original 1m samples were re-analysed.</p> <p>For diamond holes, core samples were sampled by cutting half cores at variable lengths according to lithology, structure and mineralisation. Sample preparation for RC holes generally involved splitting samples to 2 to 3 kg prior to dispatch to the laboratory for analysis. Details of laboratories used for historic assaying is not currently available, but SGS in Perth was used for NMG/NMG drill holes.</p> <p><b>Crown Prince</b></p> <ul style="list-style-type: none"><li>A total of 1,157 drill holes were used in the Mineral Resource Estimate. Of these 80 are diamond holes and 1,077 are RC holes.</li><li>No RAB or AC hole were used in the Mineral Resource Estimate.</li><li><u>RC Drilling:</u><br/>RC samples were collected and split into even 1 metre intervals where samples were dry. Wet samples were speared, or on occasion sampled by scooping.</li></ul> | Period                     | Company       | 1973 - 1991 | Esso, WMC, Endeavour | 1991 - 2002 | St Barbara | 2002 - 2012 | Mercator Gold, Silver Swan | 2013 - 2019 | Doray Minerals | 2019 - 2020 | NMG | 2020 - 2024 | NMG | Hole Type | No. of holes | Total Length | No. of Assays | DD | 2 | 396.7 | 39 | RAB | 108 | 4,527.0 | 914 | RC | 270 | 23,560.0 | 10,358 | RCDD | 2 | 347.7 | 71 | SRC | 4 | 345.0 | 109 | Sub Total | 386 | 29,176.4 | 11,491 | Hole Type | No. of holes | Total Length | No. of Assays | DD |  |  |  | RAB | 37 | 1,555.0 | 289 | RC | 60 | 5,057.0 | 2,808 | RCDD |  |  |  | SRC |  |  |  | Sub Total | 97 | 6,6607.0 | 3,097 | Hole Type | No. of holes | Total Length | No. of Assays | DD | 2 | 396.7 | 39 | RAB | 145 | 6,082.0 | 1,203 | RC | 330 | 28,617.0 | 13,166 | RCDD | 2 | 347.7 | 71 | SRC | 4 | 345.0 | 109 | TOTAL | 483 | 35,783.4 | 14,588 |

| obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. | <p>RC drill chips from each metre were examined visually and logged by the geologist. Evidence of alteration or the presence of mineralisation was noted on the drill logs. The presence or absence of mineralisation was initially determined visually by the site geologist, based on experience and expertise in evaluating the styles of mineralisation being sought.</p> <p>Intervals selected by the site geologist were evaluated by hand-held XRF and all those with elevated metal content have been bagged and numbered for laboratory analysis.</p> <p>Duplicate samples were submitted at a rate of approximately 10% of total samples taken (i.e. one duplicate submitted for every 20 samples). The hand-held Delta XRF Analyser was calibrated before each session and was serviced according to the manufacturer's (Olympus) recommended schedule.</p> <p>• <u>Diamond Drilling:</u><br/>Diamond holes were drilled with HQ size (63.5mm diameter) rods. Triple tube coring was used to maximise core recovery. Diamond core was examined visually and logged by the geologist. Where selected, core was generally sampled at 1 metre intervals, unless visual observations warranted narrower intervals. Core was marked up and cut into half and quarter core for duplicates using a diamond blade saw. Visual observation of alteration/mineralisation was noted on the drill logs.</p> <p>Duplicate samples for DD were submitted at a rate of approximately 4% of total samples (i.e. one duplicate submitted per 25 samples).</p> <p>• <u>Sample Preparation:</u><br/>RC and Diamond core samples were sent to either Intertek (Perth) for Au analysis by FA50 (Fire Assay on 50g charge) or to Nagrom (Perth) for Au analysis by 50g FA50 and a 7 element analysis by 4 acid digest. Sample preparation techniques are well established and are international standard industry best practice. Drill chip and core samples were dried, crushed and pulverised (whole sample) to 95% passing 75µm and assayed using ICP AES and ICP IMS following four-acid digest for the 7 element analysis; and Fire Assay for gold following a four-acid digest in Teflon tubes of a 50g charge.</p> <p><b>Cloudkicker</b></p> <ul style="list-style-type: none"> <li>• A total of 99 drill holes were used in the Mineral Resource Estimate. Diamond sub-sampling techniques and sample preparation:</li> <li>• Diamond samples were half cored using a large diamond blade core saw and quarter cored when duplicates were taken.</li> <li>• Core samples were sent to Nagrom in Perth for Au assay by 50g fire assay and a 7 element analysis by 4 acid digest.</li> <li>• Sample preparation techniques are well established standard industry best practice. Core was dried, crushed and pulverised (whole sample) to 95% of the sample passing 75µm grind size.</li> <li>• Field QC procedures included using certified reference materials as assay standards. One duplicate sample was submitted for approximately every 25 samples.</li> <li>• Assay results of standards, blanks and duplicate core samples were within acceptable limits of variability.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Drilling is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource Estimation process and classifications applied. It is recommended that additional drilling be carried out prior to mining as the drill spacing is not sufficient to support effective mining decisions given the complexity in some areas.</li> <li>All domains bar 5100 where composited to 1m intervals, with any residual of less than 0.2m distributed evenly across the composites. Domain 5100 was composited to 4m intervals in line with the sample lengths in that domain</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p><b>Orientation of data in relation to geological structure</b></p> <ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul> | <p><b>Abbotts</b></p> <p>Holes are drilled at a 60 degree inclination to intersect a sub-vertical dipping orebody; this is not considered to have introduced any sampling bias</p> <p><b>Crown Prince</b></p> <ul style="list-style-type: none"> <li>The most recent drill programme was designed to infill previous drilling along the well defined South East Zone and to define extents of new quartz lode in the west. Sufficient data has been collected for the majority of the Deposit to be able to establish true widths, orientation of lithologies, relationships between lithologies and the nature of any structural controls.</li> <li>Data collected so far presents no suggestion that any sampling bias has been introduced.</li> <li>The orientation of the bulk of the drilling is approximately perpendicular to the strike of the steeply dipping mineralisation and is unlikely to have introduced any significant sampling bias.</li> </ul> <p><b>Cloudkicker</b></p> <ul style="list-style-type: none"> <li>The most recent drill programme was designed to infill the previous drilling along the NE structure and to find NE extents. All the current drill holes within this area have been drilled 320°-330° north westerly at -60° dip. Sufficient data has been collected for the majority of the Deposit to be able to establish true widths, orientation of lithologies, relationships between lithologies and the nature of any structural controls.</li> <li>Data collected so far presents no suggestion that any sampling bias has been introduced.</li> <li>The orientation of the bulk of the drilling is approximately perpendicular to the strike of the steeply dipping mineralisation and is unlikely to have introduced any significant sampling bias.</li> </ul> <p><b>Lydia</b></p> <ul style="list-style-type: none"> <li>The most recent drill programme was designed to infill the previous drilling along the main Lydia Shear Zone. All the current drill holes within this area have been drilled 110° east/south-easterly at -60° dip. Sufficient data has been collected for the majority of the Deposit to be able to establish true widths, orientation of lithologies, relationships between lithologies and the nature of any structural controls.</li> <li>Data collected so far presents no suggestion that any sampling bias has been introduced.</li> <li>The orientation of the bulk of the drilling is approximately perpendicular to the strike of the steeply dipping mineralisation and is unlikely to have introduced any significant sampling bias.</li> <li>There are isolated areas in the deposit, in particular in domain 1000, where the majority of the data is based on holes drilled sub parallel to the dip of the mineralisation. This may introduce bias into the estimation process and also makes interpreting the domain and modelling the width correctly difficult. This has been taken into account with the classification of the domain and it is recommended that the areas affected are followed up with drilling from west to east which will better define the width of the mineralisation.</li> </ul> |

| <b>Geology</b> <ul style="list-style-type: none"> <li>• Deposit type, geological setting and style of mineralisation.</li> </ul> | <p><b>Abbotts</b></p> <p>The Abbotts greenstone belt is a structurally deformed Archean-age package of mafic, ultramafic, and felsic volcanoclastic rocks that is prospective for gold and base metal deposits. Gold mineralisation is associated with quartz veins in various rock types including sediments, volcanoclastics, mafics and ultramafics, and has a spatial association with the northeast trending Abernethy Shear Zone</p> <p><b>Crown Prince</b></p> <ul style="list-style-type: none"> <li>• The Garden Gully project comprises most of the Abbotts Greenstone Belt; comprised of Archean rocks of the Greensleeves Formation (Formerly Gabanintha); a bimodal succession of komatiitic volcanic mafics and ultramafics overlain by felsic volcanics and volcanoclastic sediments, black shales and siltstones and interlayered with mafic to ultramafic sills. Regional synclinal succession trending N-NE with a northern fold closure postdating E-W synform, further transected by NE trending shear zones, linearity with the NE trend of the Abernathy Shear, which is a proven regional influence on structurally controlled gold emplacement in Abbotts and Meekatharra Greenstone Belts and in the Meekatharra Granite and associated dykes.</li> <li>• Au in the Southernmost tenements (E51/1989, E51/2002, E51/1936) have a similar orogenic depositional style to the rest of the Garden Gully Prospects but is hosted within the Meekatharra-Wydege greenstone belt. The area is characterised by the Norrie group and the Meekatharra Formation (part of the Poelle Group). The Noorie Group comprises of thick successions of pillowed and massive tholeiitic basalts and conformably overlying felsic volcanics with interbedded Banded Iron Formation and felsic rocks of the Yaloginda Formation. The Meekatharra formation is composed of weakly metamorphosed basalt komatiic basalt and other ultramafic rocks. The Au is associated with the Burnakura Shear Zone which is again typical of a brittle to semi-ductile shear zone which would form semi-continuous dilatational veins. The local Burnakura Mine (under care and maintenance by Monument) is located approximately 3km away from NMG tenements and features mineralisation dominated by steeply dipping quartz (±minor sulphides) veins orientated parallel to the foliation of the fault zone.</li> <li>• Mineralisation in the West Caledonian tenements (E51/1709 and E51/2013) can be shown in the Kohinoor open pit mine. This is an isolated gold mine and features Au mineralisation located on the contact between banded iron formations and meta basalts and associated with steep SW plunging ore shoots which are structurally controlled by shear zone orientated NW-SE. Within this mine there is a high association with sulphides (pyrite and pyrrhotite) and quartz veining which runs parallel to the shear zone. Much of the tenement is largely untested greenstone belt.</li> <li>• The project is blanketed by broad alluvial flats, occasional lateritic duricrust and drainage channels braiding into the Garden Gully drainage system. Bedrock exposures are limited to areas of dolerite, typically massive and unaltered. Small basalt and metasediment outcrops exist, with some exposures of gossanous outcrops and quartz vein scree. Gold bearing quartz reefs, veins and lodes occur almost exclusively as siliceous impregnations into zones within the Kyarra Schist Series, schistose derivatives of dolerites, gabbros and tuffs, typically occurring close to axial planes of folds and within anastomosing ductile shear zones.</li> <li>• Gold mineralisation at Crown Prince is contained within quartz carbonate veins and surrounding alteration zones hosted within a package of mafic rocks including mafic schist (after dolerite and basalt) and occasional ultramafic and high magnesium basalts. The mineralised zones are related to</li> </ul> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <p><b>Estimation and modelling techniques</b></p> <ul style="list-style-type: none"> <li>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</li> <li>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</li> <li>The assumptions made regarding recovery of by-products.</li> <li>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</li> <li>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</li> </ul> | <p>Statistical analysis and variography was carried out on the mineralised one metre composited drillhole data to generate top cut values and kriging parameters.</p> <p>Top cuts were 40 g/t Au for New Murchison King and 7 g/t Au for Mt Vranizan.</p> <p>Grade estimation was carried out on drillhole data using the Ordinary Kriging functionality in Micromine 2026.3 software.</p> <p>Parent blocks of 2 m(E) by 5 m(N) by 5 m(RL) have been used, with sub-celling to 1m by 1m by 1m to follow mineralisation boundaries. Estimation was carried out for gold only.</p> <p>An Indicator Mineralisation Model was used to define a ‘mineralised envelope’, which was used to control modelling.</p> <p>A dynamic search ellipse was used to honour strike and dip variations.</p> <p>The resource model was generated using an Ordinary Kriging interpolation method, with a multi-pass search approach. The first search ellipsoid had dimensions of 25m x 25m x 5m with a minimum of 8 samples and a maximum of 16. The second search, used where not enough data was found in the first search had dimensions 50m x 50m x 7m, with a third pass at 100m x 100m x 9m to completely populate the mineralised blocks</p> <p><b>Crown Prince</b></p> <ul style="list-style-type: none"> <li>The Mineral Resource Estimate was generated using ordinary kriging to estimate gold content and variability. A total of 42 mineralisation wireframes were generated based on geological logging and assay data, of which Domain 3001 represented the majority of the known mineralisation. For all domains samples were composited to intervals based on assessment of the raw input sample statistics (1m for all domains). Assay composite data was analysed geostatistically in Leapfrog Edge to identify the population statistics and appropriate top cut (applied as a cap to the assay grades). A normal scores transform was used to de-skew the data for analysis of grade continuity using variogram analysis. Variograms were generated for each domain where sufficient data would allow and orientation and ranges were used to constrain the Interpolation parameters. Most domains were estimated with three passes with the pass ranges and min/max number of samples optimised to allow for an accurate global estimate that minimises localised over-smoothing. The mineralisation has generally been extrapolated to one times the nominal drill pattern, which is approximately 20m in most cases. The Block Model was generated in Leapfrog Edge and included a range of attributes including oxidation state, bulk density, mining depletion, mineralised domain codes, resource classification and estimation data as well as an estimated gold grade.</li> <li>There is a significant increase in both tonnes and grades in the current mineral resource estimate compared to the previous estimate completed by Cube Consulting in 2024. This is as a result of additional drilling within the Crown Prince Deposit enabling conversion of Inferred to Indicated resource classification.</li> <li>No by or co-products have been considered.</li> <li>No deleterious elements were recorded within the available assay data, and none have been considered in this Mineral Resource Estimate.</li> <li>The parent block size used for estimation was 5mX x 5mY x 2.5mZ with a minimum sub cell size of 0.625m in all dimensions. The block size represents approximately half the drill spacing in the X and Y directions for the well-informed regions of the model and is considered reasonable given the drill spacing and lode geometry. The search varies by domain and estimation pass but generally direction 1 is aligned to the range of the variograph per domain.</li> <li>No assumption of selective mining unit has been made as part of the Mineral resource estimate.</li> <li>No assumptions were made regarding correlation between variables and only one variable, gold, has been estimated.</li> <li>The geological domains were estimated independently, with “Hard” boundaries between mineralised and waste material, and soft boundaries between different weathering states.</li> <li>All domains were assessed for high grade top cuts (applied as a cap to the composite grades after variography). The application of a cap is intended to limit the influence of extreme values on the population statistics. The cap value was determined using the population disintegration method and varied by domain, with 30 of the 42 domains requiring some form of top cap to be applied.</li> <li>On completion of the estimation process, the estimated grades for each domain were validated against input data using four methods, a visual comparison of block grades and the drillhole data in long and cross section, a global comparison of the average composite and estimated grades, swath plots generated in x, y and z comparing the mean block grades to the mean composite grades and finally by comparing the histogram of the</li> </ul> |

                                                                                                             | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Results of the validation process indicated that the block grades compare well with the drillhole data.</p> <ul style="list-style-type: none"> <li>Depletions were created using the March EOM surface survey of the Crown Prince Open Pit on the 1st of April. Depletions of the underground were created after reviewing historic reporting from Kyarra Gold Mine.</li> </ul> <p><b>Cloudkicker</b></p> <ul style="list-style-type: none"> <li>The Mineral Resource Estimate was generated using ordinary kriging to estimate gold content and variability. A total of 13 mineralisation wireframes were generated based on geological logging and assay data. For all domains samples were composited to 1m intervals based on assessment of the raw input sample statistics. Assay composite data was analysed geostatistically in Leapfrog Edge to identify the population statistics and appropriate top cut (applied as a cap to the assay grades). A normal scores transform was used to de-skew the data for analysis of grade continuity using variogram analysis. Variograms were generated for each domain where sufficient data would allow and orientation and ranges were used to constrain the Interpolation parameters. Most domains were estimated with three passes with the pass ranges and min/max number of samples optimised to allow for an accurate global estimate that minimises localised over-smoothing. The mineralisation has generally been extrapolated to one times the nominal drill pattern, which is approximately 20m in most cases. The Block Model was generated in Leapfrog Edge and included a range of attributes including oxidation state, bulk density, mining depletion, mineralised domain codes, resource classification and estimation data as well as an estimated gold grade.</li> <li>No history of mining at Cloudkicker, there are no depletions to apply to this resource.</li> <li>There is a significant increase in both tonnes and grades in the current mineral resource estimate compared to the previous estimated completed by Cube Consulting in 2025. This is as a result of additional drilling within the Crown Prince East Desposit enabling conversion of Inferred to Indicated resource classification.</li> <li>No by or co-products have been considered.</li> <li>No deleterious elements were recorded within the available assay data, and none have been considered in this Mineral Resource Estimate.</li> <li>The parent block size used for estimation was 10mX x 10mY x 10mZ with a minimum sub cell size of 0.625m in all dimensions. The block size represents approximately half the drill spacing in the X and Y directions for the well-informed regions of the model and is considered reasonable given the drill spacing and lode geometry. The search varies by domain and estimation pass but generally direction 1 is aligned to the range of the variograph per domain.</li> <li>No assumption of selective mining unit has been made as part of the Mineral resource estimate.</li> <li>No assumptions were made regarding correlation between variables and only one variable, gold, has been estimated.</li> <li>The geological domains were estimated independently, with “Hard” boundaries between mineralised and waste material, and soft boundaries between different weathering states.</li> <li>All domains were assessed for high grade top cuts (applied as a cap to the composite grades after variography). The application of a cap is intended to limit the influence of extreme values on the population statistics. The cap value was determined using the population disintegration method and varied by domain, with 9 of the 13 domains requiring some form of top cap to be applied.</li> <li>On completion of the estimation process, the estimated grades for each domain were validated against input data using four methods, a visual comparison of block grades and the drillhole data in long and cross section, a global comparison of the average composite and estimated grades, swath plots generated in x, y and z comparing the mean block grades to the mean composite grades and finally by comparing the histogram of the composite data to the histogram of the block data for each domain. Results of the validation process indicated that the block grades compare well with the drillhole data.</li> </ul> <p><b>Lydia</b></p> <ul style="list-style-type: none"> <li>The Mineral Resource Estimate was generated using ordinary kriging to estimate gold content and variability. A total of 16 mineralisation wireframes were generated based on geological logging and assay data, of which Domain 1000 represented the majority of the known mineralisation. For all domains samples were composited to intervals based on assessment of the raw input sample statistics (4m for domain 5100 and 1m for all other</li> </ul> |

|                                                                                                                                                                   | <p>domains). Assay composite data was analysed geostatistically in Leapfrog Edge to identify the population statistics and appropriate top cut (applied as a cap to the assay grades). A normal scores transform was used to de-skew the data for analysis of grade continuity using variogram analysis. Variograms were generated for each domain where sufficient data would allow and orientation and ranges were used to constrain the Interpolation parameters. Most domains were estimated with three passes with the pass ranges and min/max number of samples optimised to allow for an accurate global estimate that minimises localised over-smoothing. The mineralisation has generally been extrapolated to one times the nominal drill pattern, which is approximately 20m in most cases. The Block Model was generated in Leapfrog Edge and included a range of attributes including oxidation state, bulk density, mining depletion, mineralised domain codes, resource classification and estimation data as well as an estimated gold grade.</p> <ul style="list-style-type: none"> <li>• No mining depletions are known and as such, no depletions have been applied.</li> <li>• There is a significant increase in both tonnes and grades in the current mineral resource estimate compared to the previous estimated completed by Cube Consulting in 2025. This is as a result of additional drilling within the Lydia Deposit enabling conversion of Inferred to Indicated resource classification.</li> <li>• No by or co-products have been considered.</li> <li>• Deleterious elements were not included in this Mineral Resource Estimate as none were flagged in the current assay suite. If metallurgical test work subsequently demonstrates that arsenic influences extraction performance, routine analysis and estimation of this element will need to be implemented.</li> <li>• The parent block size used for estimation was 10mX x 10mY x 10mZ with a minimum sub cell size of 0.625m in all dimensions. The block size represents approximately half the drill spacing in the X and Y directions for the well-informed regions of the model and is considered reasonable given the drill spacing and lode geometry. The search varies by domain and estimation pass but generally direction 1 is aligned to the range of the variograph per domain.</li> </ul> <p>No assumption of selective mining unit has been made as part of the Mineral resource estimate.</p> <ul style="list-style-type: none"> <li>• No assumptions were made regarding correlation between variables and only one variable, gold, has been estimated.</li> <li>• The geological domains were estimated independently, with “Hard” boundaries between mineralised and waste material, and soft boundaries between different weathering states.</li> <li>• All domains were assessed for high grade top cuts (applied as a cap to the composite grades after variography). The application of a cap is intended to limit the influence of extreme values on the population statistics. The cap value was determined using the population disintegration method and varied by domain, with 8 of the 16 domains requiring some form of top cap to be applied.</li> <li>• On completion of the estimation process, the estimated grades for each domain were validated against input data using four methods, a visual comparison of block grades and the drillhole data in long and cross section, a global comparison of the average composite and estimated grades, swath plots generated in x, y and z comparing the mean block grades to the mean composite grades and finally by comparing the histogram of the composite data to the histogram of the block data for each domain. Results of the validation process indicated that the block grades compare well with the drillhole data.</li> </ul> |
| <b>Moisture</b> <ul style="list-style-type: none"> <li>• Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of</li> </ul> | <b>Abbotts</b><br>Tonnages are reported on a dry basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Mining factors or assumptions</b> <ul style="list-style-type: none"> <li>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported</li> </ul> | <p><b>Abbotts</b><br/> It is assumed that mining will be by conventional open pit techniques. Reasonable Prospects for Eventual Economic Extraction (RPEEE) have been considered and the Mineral Resource is constrained by open pit optimisation, using similar cost/price parameters as used at NMG's operating Crown Prince gold mine.</p> <p><b>Crown Prince</b><br/> <ul style="list-style-type: none"> <li>Crown Prince has been in active production since July 2025 and employs conventional surface mining techniques (hydraulic backhoe excavator and diesel haul truck) along with a minimum mining width of 2m. At its narrowest the mineralisation is less than 1m wide which will result in additional mining dilution.</li> <li>Historical surface mining was undertaken by prospectors and previous UG mining by Kyarra Gold Mines up to 1915. Historical maps and documentation have provided good background information for any future UG mining considerations for deeper gold mineralisation.</li> <li>Most of the gold mineralisation modelled to date occurs within 200 m vertical depth from the surface in broad shallow oxide mineralisation zones extending into high-grade mineralisation recorded from recent drilling and recorded in the historical UG workings. Therefore, bulk OP mining at 2.5 m to 5 m bench heights was assumed for resource modelling and mineral resource estimation.</li> <li>Mined gold mineralisation is expected to be transported for processing at a nearby gold treatment plant, 40 km south of Crown Prince near Meekatharra.</li> <li>The minimum bench height dimension for mining is assumed to be 2 m, and this was used as the minimum thickness for the mineralisation estimation domains. Minimum internal waste intervals are nominally 2 m, although broader subgrade zones were interpreted for the bulked-out supergene mineralisation zone in order to maintain consistent domain continuity.</li> <li>Pit optimisation analysis is currently being undertaken by NMG.</li> <li>For deeper material below the open-pit shell, extraction is assumed via underground mining methods appropriate for narrow-margin or structurally controlled lodes, with specific engineering parameters currently being refined via ongoing feasibility studies.</li> </ul> </p> |

| <b>Environmental factors or assumptions</b> <ul style="list-style-type: none"><li>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</li></ul> | <b>Abbotts</b><br>Environmental factors have not been considered in detail. There are not anticipated to be any issues, as NMG is operating the nearby Crown Prince mine.                                                                                                                                                                                                                                                                                                                                                    |            |      |    |      |       |     |     |     |            |     |     |     |       |   |     |      |

| <p><b>Classification</b></p> <ul style="list-style-type: none"> <li>The basis for the classification of the Mineral Resources into varying confidence categories.</li> <li>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</li> </ul> | <p><b>Abbotts</b></p> <p>The Mineral Resource has been classified in the Inferred category, in accordance with the 2012 Australasian Code for Reporting of Mineral Resources and Ore Reserves (JORC Code). A range of criteria has been considered in determining this classification including:</p> <ul style="list-style-type: none"> <li>Geological continuity;</li> <li>Data quality;</li> <li>Drill hole spacing;</li> <li>Modelling technique;</li> <li>Estimation properties including search strategy, number of informing data and average distance of data from blocks.</li> </ul> <p>The resource classification methodology incorporated a number of parameters derived from the kriging algorithms in combination with drill hole spacing and continuity and size of mineralised domains.</p> <p>Drill hole location plots have been used to ensure that local drill spacing conforms to the minimum expected for the resource classification. Inferred material is confined to areas where resource definition drilling is between 20m and 50m spacing.</p> <p>Blocks informed in search pass 3 are generally assigned to the Unclassified category, and not included in optimisation or reporting.</p> <p>During the review of classification some blocks have been excluded from the Inferred classification and re-assigned to Unclassified, due to lack of data, or excessive extrapolation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
