

QUATERLY ACTIVITIES REPORT – DECEMBER 2025

HIGHLIGHTS

- **Nine drill holes, for 2,806m, completed in maiden drilling program at Orión EU Critical Minerals Project**
- **Exceptional results received from first two drill holes**

Table 1 – Summary of Initial Drill Hole Results in Target Zone*

OSM Initial Drill Hole Results Summary - In-Situ Grades				
	Primary Seam		High-Grade Sub Seam	
	AV-01	AV-01bis	AV-01	AV-01bis
From	108.45m	105.75m		
Thickness	3m	3m	1.5m	1.8m
Rutile	10.2%	13.0%	15.7%	18.8%
Zircon	6.1%	8.0%	9.8%	11.9%
TREO	0.72%	0.89%	1.15%	1.29%

- **Focus remains on high-grade area of ~10km² in Zone 1 (Target Area)**
- **13 channel samples, three bulk samples and the first three drill holes from Target Area all show outstanding high-grades of titanium (rutile and ilmenite) and zircon with rare earth element and silica upside**
- **Scoping Study level metallurgical test work program on bulk samples from Zone 1 substantially completed with initial results anticipated in the coming weeks**
- **Mineral Resource Estimate targeted for completion on Target Area as a priority to enable mine planning**
- **Scoping Study targeted for 2H, CY26 initially focusing on Target Area**
- **Downstream product initiatives in train to take advantage of potential grade and scale**
- **Spanish centric and EU funding, partner and product strategies progressing**
- **Pro Forma Cash at Bank as at 31 December 2025 post placement was over A\$8.5m.**

Osmond Resources Limited (ASX: OSM) (Osmond or the Company) is pleased to provide its December 2025 Quarterly Activities Report.

Orion EU Critical Minerals Project

Overview

The Orión EU Critical Minerals Project (**Orión** or **the Project**) is located in Jaén Province, Andalucía, Southern Spain (refer Figure 1 below). The Project includes 756 Spanish mining units (cuadrículas mineras) covering an area of 228 km².

* refer ASX releases dated 18 and 24 November 2025

It is a siliciclastic geological system with various layers rich in critical minerals including rutile and ilmenite (titanium), zircon, hafnium, and monazite (rare earth elements). The Project area was explored for thorium and uranium in the 1950s and 1960s and includes a historic galena mine.

Extensive geological mapping activities have been completed across the three target zones of the Orión permit. The activities have identified multiple Ti-Zr-REE rich layers across a wide area of the Project (refer ASX announcements dated 6 September 2024, 19 November 2024, 28 January 2025, 7 April 2025 and 19 June 2025).

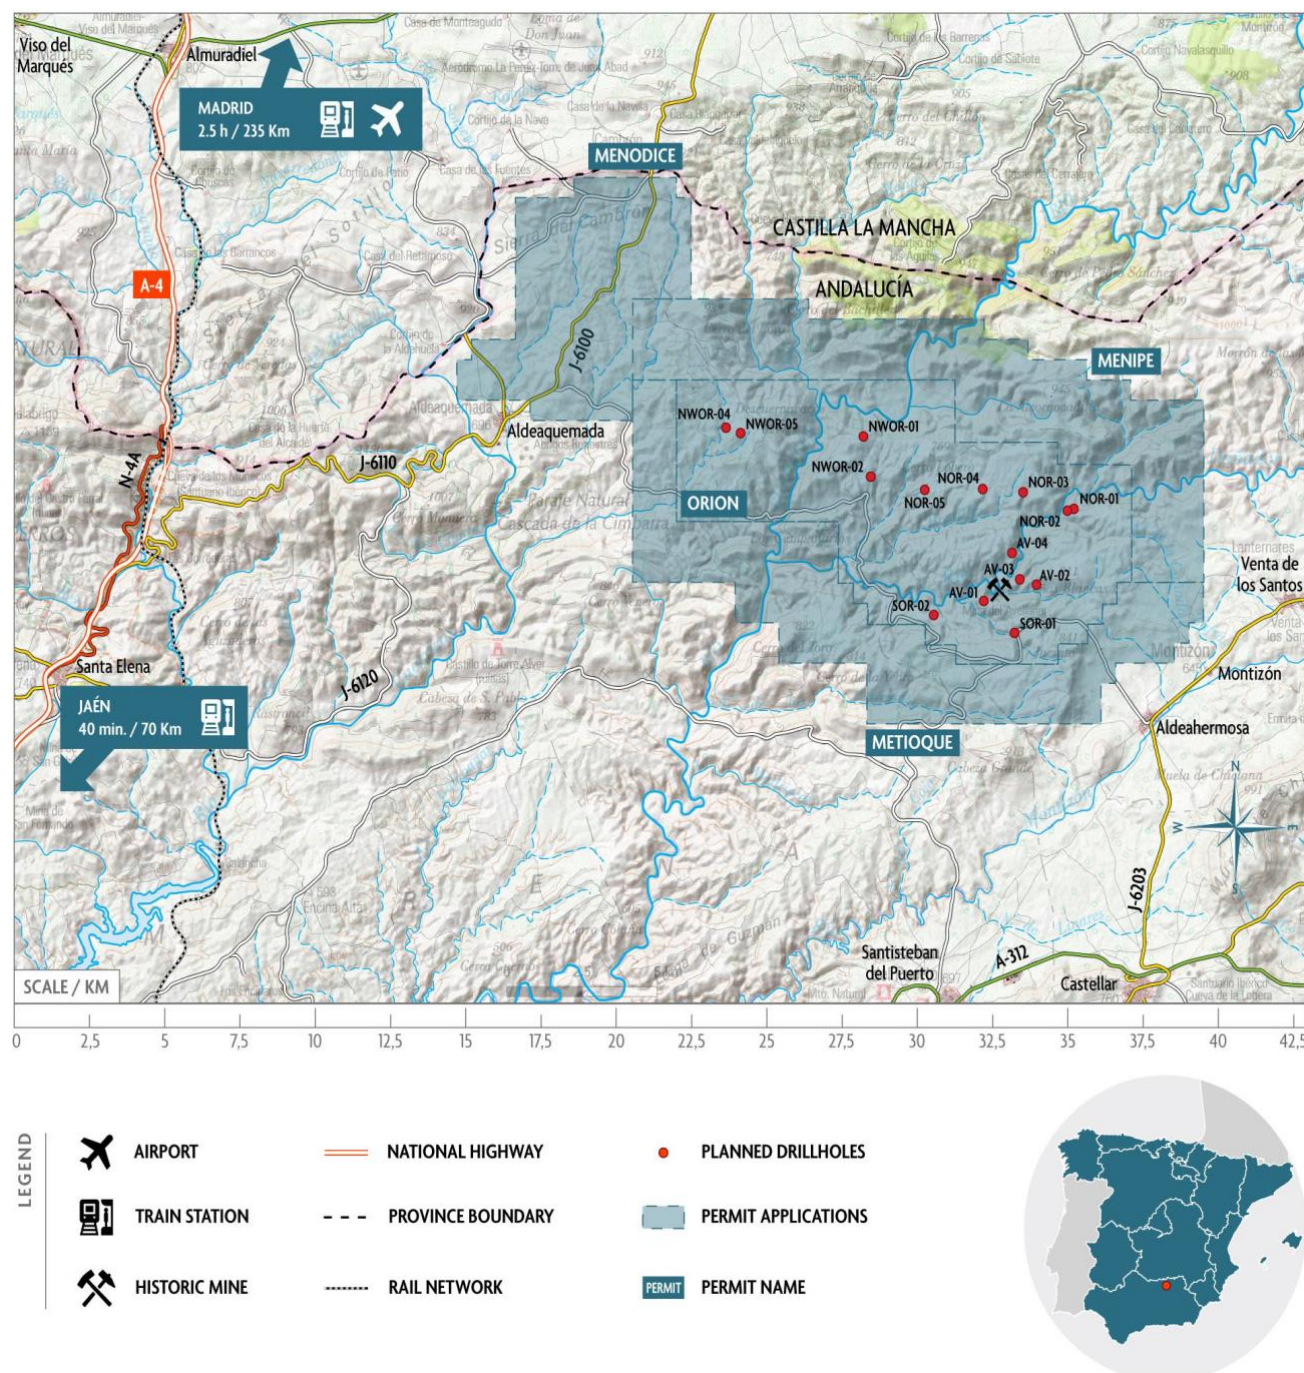

Figure 1 – Map showing Orión EU Critical Minerals Project location.

Drilling Activities

During the Quarter, the Company completed nine drill holes (refer Figure 2 and Appendix A below). Table 1 below shows a summary of assay results from the initial two holes and key economic minerals / oxides (refer ASX release of 18 November 2025 and 24 November 2025).

Table 1 – Summary of Initial Drill Hole Results in Target Zone

OSM Initial Drill Hole Results Summary - In-Situ Grades				
	Primary Seam		High-Grade Sub Seam	
	AV-01	AV-01bis	AV-01	AV-01bis
From	108.45m	105.75m		
Thickness	3m	3m	1.5m	1.8m
Rutile	10.2%	13.0%	15.7%	18.8%
Zircon	6.1%	8.0%	9.8%	11.9%
TREO	0.72%	0.89%	1.15%	1.29%

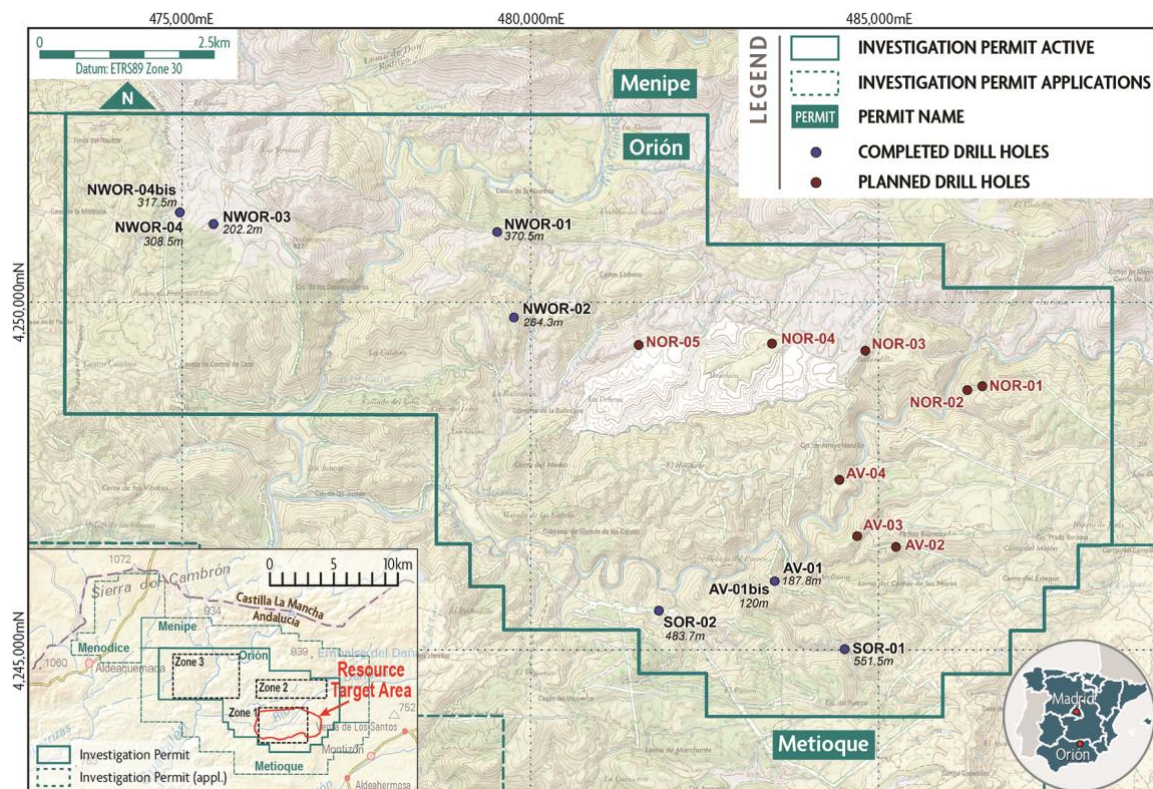

Figure 2 – Map showing location of drill holes at the Orión EU Critical Minerals Project.

Additional assay results from the relatively lower grade Zone 3 are expected over the coming weeks. The Company's drilling program is expected to recommence shortly with a focus on the Target Area shown in Figure 3 below.

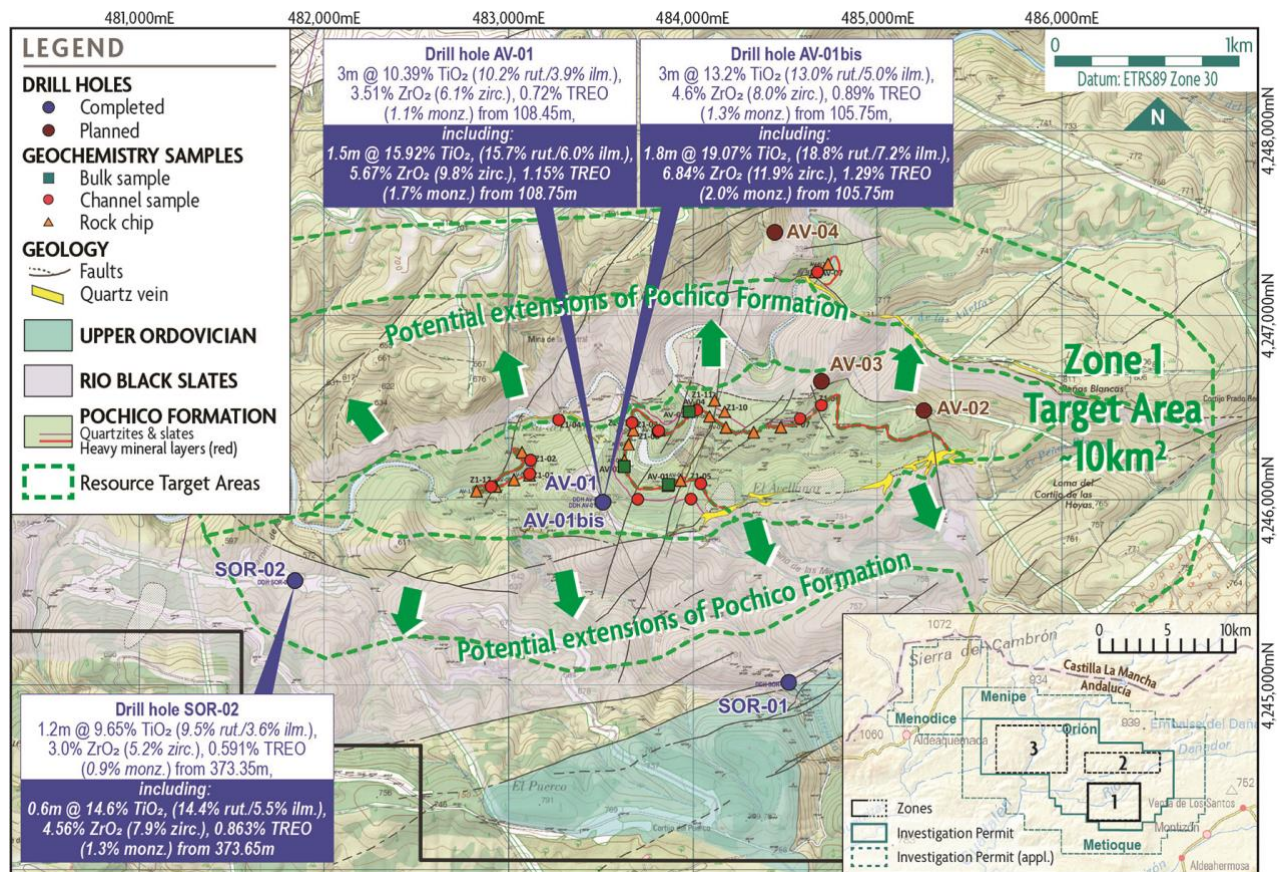

Figure 3 – Map Showing Target Area and Key Initial Drill Hole Results.

Project Execution

The Company's main focus is on advancing the Project to Scoping Study completion as quickly as possible. To facilitate this the Company is seeking to:

1. Complete resource drilling in the Target Area (refer to Figure 1 and 2) (1H, CY26)
2. Delineate a maiden JORC Code compliant Mineral Resource Estimate (1H, CY26)
3. Complete current Scoping Study metallurgical test works (1H CY26). Results and flow sheet design from bulk sample testing is substantially completed with initial results anticipated in the coming weeks (Q1, CY26)
4. Complete mine planning, process plant, utilities and logistics strategies (1H, CY26)
5. Complete Scoping Study for the Target Area (2H, CY26).

Completion of the Scoping Study is likely to be a critical juncture for the Company as it is expected to demonstrate a very compelling EU based rutile, ilmenite, zircon and rare earth project.

The Scoping Study will further the Company's aspiration to be the only company extracting titanium, zirconium (and hafnium), and rare earth elements in the EU.

Metallurgical Test Works

In March 2026 the Company will initiate the second round of metallurgical test works aimed at developing a Feasibility Study level flow sheet. The Company expects to be in a position to release key Scoping Study level metallurgical results and preliminary flow sheet design in the current Quarter.

Product, Partners and Government Strategy

To compliment project execution activities, the Company is progressing various downstream product related initiatives to take advantage of the potential grade and scale of the Project. The activities can be summarised as:

1. Progress downstream product related initiatives with respect to titanium (rutile and ilmenite), zircon, rare earths and silica metal with a focus on EU and North American markets
2. Progress discussions with Spanish centric and EU funding, project and product partners.

Iberian One Project

The Company continues to consider options with respect to progressing its Iberian One Project noting the immediate focus is on the flagship Orión EU Critical Minerals Project.

Yumbarra Project

The Company commenced the surrendering process for the Yumbarra Project (EL6417) in the Quarter.

Corporate

Placement

Post Quarter end the Company completed a strongly supported A\$6.6m placement. Pro forma cash at bank as at 31 December 2025, inclusive of the placement, was over A\$8.5m.

The placement was Company led and cornerstoned by two existing institutional shareholders.

Placement details are below:

- a total of 11M Placement Shares to be issued at A\$0.60 per share representing a 16.7% discount to the Company's last traded price on 7 January 2026 and an 18.2% discount to the 5-day VWAP;
- the 5.5M Placement Options are exercisable at A\$1.20 on or before 31 December 2027;
- the Placement is to be issued under the Company's placement capacity pursuant to ASX Listing Rule 7.1 (11,000,000 securities) and 7.1A (5,500,000 securities); and
- settlement of the Placement was Thursday 22 January 2026.

The funds raised by the issue of the Placement Shares will be used to progress the Orión EU Critical Minerals Project and the Company's aspiration to become the first EU miner of three strategically important minerals: 1. Titanium (rutile), 2. Zircon (and Hafnium), and 3. Rare Earths (monazite); and to pay for the costs of the offer.

Annual General Meeting

Osmond held its Annual General Meeting (**AGM**) of shareholders on 26 November 2025, with all resolutions passed.

Financial Commentary

The Quarterly Cashflow Report (Appendix 5B) for the period ending 31 December 2025 provides an overview of the Company's financial activities. The Company had A\$2.37m in cash at the end of the quarter.

Expenditure on exploration during the reporting period amounted to A\$783k and included costs associated with geological consulting. Payments for administration and corporate costs amounted to A\$412k and related to costs for and associated with compliance, marketing initiatives and consulting fees. The aggregate amount of payments to related parties and their associates included in the current quarter cash flows from operating activities was A\$150k.

-Ends-

Approved for release by the Board of Osmond Resources.

Competent Person Statement

The information in this release that relates to Exploration Results is based on information compiled by Mr Fernando Palero. Mr Palero is the Chief Geologist of Iberian Critical Minerals Pty Ltd. Mr Palero is a licensed professional geologist in Spain and is a registered member of the European Federation of Geologists, an accredited organisation to which the Competent Person (CP) under JORC Code Reporting Standards must belong in order to report Exploration Results, Minerals Resources or Ore Reserves through the ASX. Mr Palero has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as a CP as defined in the 2012 edition of the Australasian Code for the Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC code). Mr Palero consents to the inclusion of this information in the form and context in which they occur.

Forward Looking Statement

The information in this release includes "forward looking statements". All statements other than statements of historical fact included in this release regarding the business strategy, plans, goals and objectives are forward looking statements. When used in this release, the words "believe", "project", "expect", "anticipate", "estimate", "intend", "budget", "target", "aim", "strategy", "estimate", "plan", "guidance", "outlook", "intend", "may", "should", "could", "will", "would", "will be", "will continue", "will likely result" and similar expressions are intended to identify forward looking statements, although not all forward looking statements contain such identifying words. These forward looking statements are based on Osmond's current expectations and assumptions about future events and are based on currently available information as to the outcome and timing of future events. The reader is cautioned that these forward looking statements are subject to all of the risks and uncertainties, most of which are difficult to predict and many of which are beyond the Company's control, incident to the extraction of the critical materials the Company intends to produce. These risks include, but are not limited to: limited operating history in the critical minerals' extraction industry and no revenue from the proposed extraction operations; the need for substantial additional financing to execute the business plan and the Company's ability to access capital and the financial markets; the Company's status as an exploration stage company dependent on a single project with no known JORC Code compliant mineral resources or reserves; and other risks. Should one or more of these risks or uncertainties occur, or should underlying assumptions prove incorrect, the actual results and plans could differ materially from those expressed in any forward looking statements. No representation or warranty (express or implied) is made as to, and no reliance should be placed on, any information, including projections, estimates, targets and opinions contained herein, and no liability whatsoever is accepted as to any errors, omissions or misstatements contained herein. The reader is cautioned not to place undue reliance on any forward looking statements, which speak only as of the date of this release. Except as otherwise required by applicable law, the Company disclaims any duty to update and do not intend to update any forward looking statements, all of which are expressly qualified by the statements in this section, to reflect events or circumstances after the date of this Presentation.

ABOUT OSMOND RESOURCES

Osmond Resources Limited (ASX:**OSM**) is an ASX listed company focused on fast-tracking the development of EU Critical Minerals Projects.

Spanish Projects

Orión EU Critical Minerals Project, Spain

Upon completion of a Scoping Study the Company will control an 80% interest in 95% of the Orión EU Critical Minerals Project (**the Project**) located in Jaén Province, Andalucía, Southern Spain (refer Figure 3 below). The Project includes 756 Spanish mining units (cuadrículas mineras) covering an area of 228 km².

It is a siliciclastic geological system with various layers rich in critical minerals including rutile (titanium), zircon, hafnium, and rare earth elements. The Project area was explored for thorium and uranium in the 1950s and 1960s and includes a historic galena mine worked in 1970s.

The Company is targeting primary high-grade rutile, zircon and monazite layers that it believes will be prevalent in all three zones. The potential grade of the layers is evidenced in bulk rock channel samples that were taken from three different outcrops (150kgs in total) across the Avellanar Zone (Zone 1) with the assay and mineral species' results shown in Table 1 below.

The Company is looking to fast-track development activities with initial drilling to confirm continuity and grade of the mineralised layers, a Mineral Resource Estimate, Scoping Study activities and confirmation of a flow sheet all expected to be completed in 1H CY26 to take advantage of strong EU regulatory support for in-sourcing production of critical minerals.

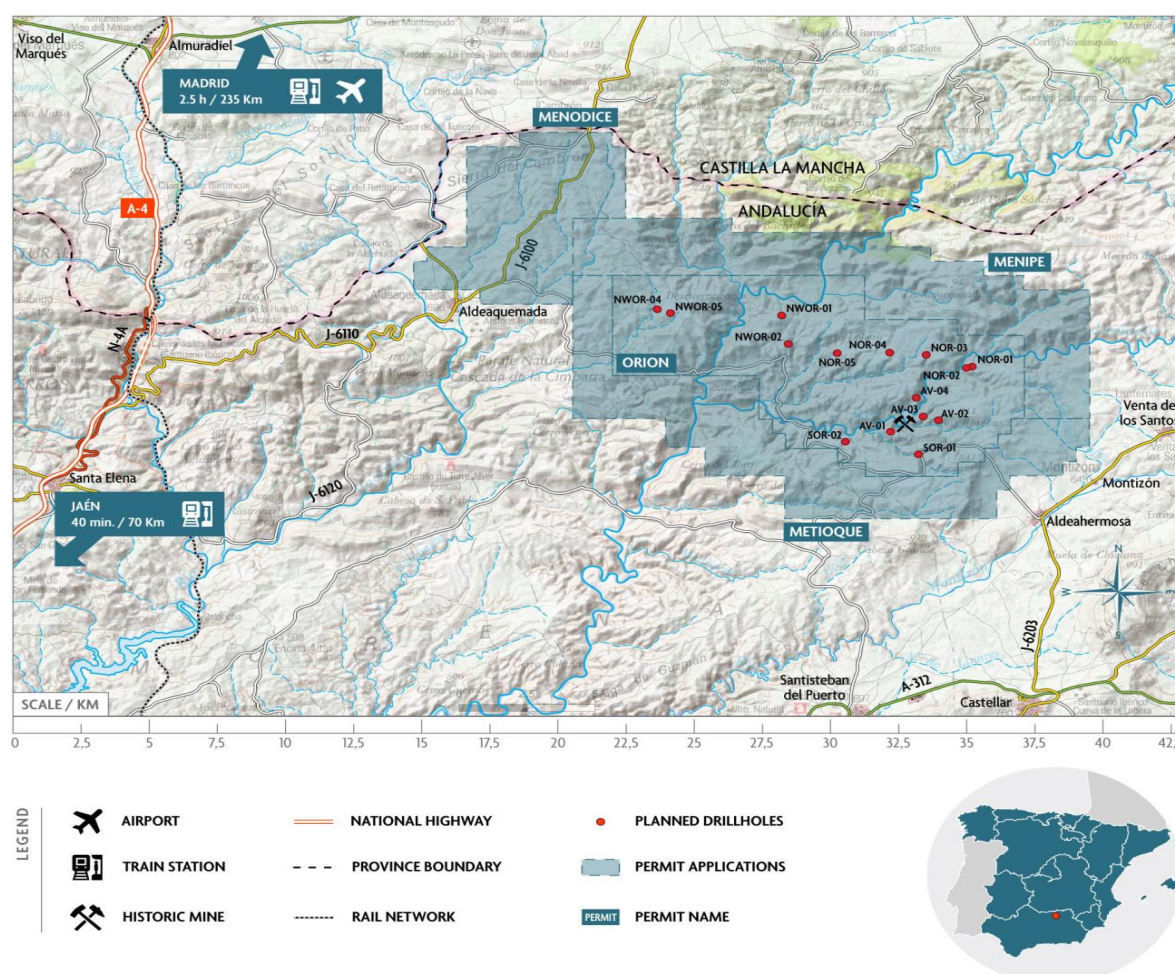

Figure 3 - Map showing Orión EU Critical Minerals Project and location of proposed drill holes.

** Heavy Minerals – allanite, monazite, xenotime, garnet, titanite, zircon, ilmenite, rutile.

[†] Refer ASX announcement 18 November 2025. Grades quoted for 3m downhole interval (108.45 - 111.45m).

[§] Refer ASX announcement 24 November 2025. Grades quoted for 3m downhole interval (105.75 - 108.75m).

AV-01 and AV-01bis mineral proportions are estimates based on bulk sampling (refer to Appendix B).

Iberian One Project, Spain

The Company owns a 100% interest in the Iberian One Project, located in Segovia Province, central Spain. The project aims to exploit kaolinite and alunite mineralisation to deliver EU critical minerals.

Osmond is working with the University of Salamanca and SGS on options to fast-track development activities to take advantage of EU critical minerals legislation and the need for extraction projects to reduce the EU's reliance on imports of alumina, potash and graphite.

Appendix B – Rutile, ilmenite, zircon and monazite grade estimates

Rutile, zircon and monazite grade estimates are based on ratios derived from assays and TIMA-X determined mineral species from bulk samples used for mineral processing test work (*refer ASX announcement 6 September 2024*). Total TiO₂% and TREO% discounted by 5% to allow for other Ti- and REE-bearing phases (e.g. anatase and xenotime, respectively). Detailed quantitative mineralogical studies to confirm relative abundances are ongoing.

Select Oxides and Primary Minerals from 150kg Bulk Sample.								
Sample	Unit	TiO ₂	Rutile	Ilmenite	ZrO ₂	Zircon	TREO	Monazite
1	%	15.2%	13.5%	6.2%	5.6%	9.8%	1.18%	1.62%

JORC TABLE 1

SECTION 1 SAMPLING TECHNIQUES AND DATA

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> Rock chip sampling: Samples of approximately 500g were collected from outcrops showing positive scintillometer readings. Samples were collected with a geological hammer across the width and strike of the anomalous layers. SPP2 and Radiacode 103 scintillometers were used as a tool to detect the layers with heavy minerals. High radiometric values than background are observed where high Ti-Zr-REE values are present. Bulk sampling: Sampling was completed by channel sampling with a geological hammer across the width of the heavy mineral seam. The layer dips gently to the north, so the channels were taken subvertical in orientation. Three representative samples, totalling 150kg, were taken (Sample 1: 78.3kg, Sample 2: 39.9kg, Sample 3: 33.5kg). Rock chip and bulk samples were collected in different areas separated by around 200m that sought to confirm the continuity and repeatability of grades and composition along the prospective layers. Core sampling: Sampled intervals from core was identified visually (lithological changes) and with assistance of scintillometer, pXRF and down hole gamma ray logging. The intervals were split in samples of 30 cm long. The diamond core was ½ cut and then ¼ cut with one of the ¼ cores sampled for assaying. Given the fine-grained texture of the prospective layers, the sample size is considered to be representative. Samples were bagged, coded and secured with plastic ties for shipping.
Drilling techniques	<ul style="list-style-type: none"> Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.). 	<ul style="list-style-type: none"> Diamond drilling with conventional wire line. OSM diamond core standard is HQ size (63.5mm diameter). PQ in the first meters OSM drilling is with standard double tube. Diamond core is not oriented however detailed bedding and structural measurements are collected during downhole geophysical logging. OSM drilling was commissioned and managed by OSM.
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> Core loss was measured for each drilling run and recorded. Recoveries were determined to be very good, approximately 100%. There was no core loss so there is no sample bias.
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> Samples in the outcrops were logged by geologists for lithology, structure, texture, colour and radiometric response. Channel sampling areas (showing sampling intervals and sample bags) were photographed. Sample logging (rock chips, channels & core) is both qualitative and quantitative. The core was logged to a level consistent with industry standards and appropriate to support Mineral Resource Estimation. The drill core has been logged with high detail. 100% of the drill core sampled by OSM drilling has been photographed and logged.

Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<ul style="list-style-type: none"> • Samples were selected by OSM geologists for assaying. • Sample preparation was carried via industry standard procedures at certified labs, ALS (Seville, Spain) and SGS (Huelva, Spain). At ALS, samples were crushed to p70 <2mm, pulverised to p85 <75 µm and split using a Boyd crusher/rotary splitter. Pulps were then sent to Galway, Ireland, for geochemical analysis. At SGS, samples were crushed to <2mm and split for assaying in Lakefield, Canada. • Bulk samples: samples were bagged, coded and secured with plastic ties for shipping to SGS. Samples were crushed to ¾" mesh. Approximately 4 kg from each sample was stage-crushed to P80 of ca. -10 mesh. Approximately 200 g from each sample was screened and recombined into six (6) size fractions based on the wt% distribution including +2 mm, -2 mm/+1.18 mm, -1.18 mm/+710 µm, -710 µm /+425 µm, -425 µm /+75 µm and -75 µm for the TIMA analysis. Replicate graphite impregnated polished mounts were prepared for the TIMA analysis. A 30g aliquot was riffled from each fraction, pulverized, and submitted for geochemical analysis. • Channel sampling have been duplicate in situ, taking a parallel channel close to the original in the same outcrop. • The diamond core was ½ cut and then ¼ cut with one of the ¼ cores sampled for assaying. The other ¼ has been used to duplicate sampling and mineralogical and metallurgical using. Sample preparation at ALS is same as detailed above.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> • <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i> 	<ul style="list-style-type: none"> • ALS: assaying was conducted using ICP-OES and XRF. Multielement analysis is done by Lithium borate fusion with ICP-MS finish (ME-MS81) and major elements with XRF finish (ME-XRF15b). Methods are considered total. The samples with overlimit are assayed by lithium meta-borate fusion and ICP-MS (ME-MS85h); and multicomponent fusion (12:22 lithium metaborate - lithium tetraborate flux containing 20% NaNO3) and XRF assay (ME-XRF15b). • SGS: assayed by XRF with borate fusion for major elements, Ti and Zr (XRF76V), ICP-MS sodium peroxide fusion for the REE, Th, U, and Y (IMS91AC1). Mineralogy determined by TIMA-X. TIMA-X analysis will include mineral identification (i.e., REE mineral speciation, gangue minerals, sulphides etc.), modal abundance, liberation and association of minerals of interest by size class, grade-recovery, exposure to predict metallurgical response. • ALS and SGS reports results for internal standards, duplicates, prep duplicates and blanks. QC data indicate acceptable levels of accuracy and precision for the elements analysed. • Channel sampling quality assays has been controlled with blanks, and duplicate assay at a rate of 1/20 for blanks and 1/10 for duplicates. OSM is using an internal CRM standard. • For the diamond drilling, OSM inserted its own control samples (blanks, duplicates and standards) at a rate of 1/20 for blanks and 1/10 for others. • Down hole geophysics was performed by International Geophysical Technologies, S.L. (IGT) using a Robertson Geologging Micrologger II model. Probes include: three-arm gauge; natural gamma radiation and resistivity; optical telescope; and acoustic telescope.
Verification of sampling and assaying	<ul style="list-style-type: none"> • <i>The verification of significant intersections by either independent or alternative company personnel.</i> • <i>The use of twinned holes.</i> • <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> • <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> • No external verification done. • No specific twin holes were drilled. • Results have been checked by company Chief Geologist and Senior Geologist. • OSM received all assay data directly from the laboratories in electronic format (xls or csv). This data is transferred to a master database and monitored for QA/QC purposes.

	<ul style="list-style-type: none"> Original lab results are reported as oxides for major elements and as ppm for minor and trace elements. REE were reported by the lab as ppm and converted by OSM to oxides.
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. <ul style="list-style-type: none"> Rock chip and channel sample locations were determined with a handheld GPS. It has an accuracy of ±2m which is sufficient given the nature of sampling program. Drill hole collar locations were determined using a handheld GPS and are consequently considered provisional. Detailed collar positions to be made using a digital GPS (DGPS) at the conclusion of the drilling program. Grid system is the official one in the survey area (ETRS89 Zone 30). Elevations determined from DEM.
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. <ul style="list-style-type: none"> Rock chip samples were taken approximately every 100m along strike (~2,000m) of the prospective layers. Channel samples have been composited over the entire thickness of the identified layer for reporting purposes. Drill hole spacing is irregular and dependent on the zone. Zone 1: 550m – 1,740m. Zone 2: 250m – 1,550m. Zone 3: 550m – 4,000m. It is considered that the spacing of samples used is sufficient for the evaluation of a Mineral Resource Estimate (JORC, 2012) given the continuity of the layers and relatively low grade variability. No drill core sample compositing has occurred.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. <ul style="list-style-type: none"> Rock chips: the prospective layers are relatively continuous where intersected by the topographic surface. Sampling is nominally at ~100m interval along strike and channel samples are taken across the full width of the prospective layer. Drill hole dips are mostly vertical or near (maximum 75°) so they intersect the sub-horizontal stratigraphy perpendicularly. No sample bias has been introduced by the drilling orientation.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. <ul style="list-style-type: none"> Chain of custody is managed by OSM. Samples were taken and transported to a secure facility for logging and taking pictures by OSM personnel. Following this, samples for assay were bagged and secured with zip locks to be shipped to ALS and SGS Labs.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. <ul style="list-style-type: none"> N/A for this release.

SECTION 2 REPORTING OF EXPLORATION RESULTS

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary																				
Mineral tenement and land tenure status	<ul style="list-style-type: none">Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.	<ul style="list-style-type: none">Tenement information:<table><tr><th>Permit Name</th><th>Permit No.</th><th>Permit Type</th><th>Status</th></tr><tr><td>Orión</td><td>16271</td><td>Investigation Permit</td><td>Granted</td></tr><tr><td>Metioque</td><td>16280</td><td>Investigation Permit</td><td>Application</td></tr><tr><td>Menodice</td><td>16281</td><td>Investigation Permit</td><td>Application</td></tr><tr><td>Menipe</td><td>16282</td><td>Investigation Permit</td><td>Application</td></tr></table>Type: Investigation Permit for resources of Section C) following the Mining Act 22/1973, Royal Decree 2857/1978 (development) and Royal Decree 975/2009 (environmental restoration).Special Conservation Area: ZEC ES6160008 “Cuecas del Rúbblar, Guadalén y Guadalmena”.The permit is owned 100% by Spanish private company Green Mineral Resources SL (GMR). Omnis Minería in turn owns 75.5% of GMR and has the right to move to 95% upon completion of a Scoping Study. At this juncture the minority non-related	Permit Name	Permit No.	Permit Type	Status	Orión	16271	Investigation Permit	Granted	Metioque	16280	Investigation Permit	Application	Menodice	16281	Investigation Permit	Application	Menipe	16282	Investigation Permit	Application

Menipe	16282	Investigation Permit	Application																			

Criteria	JORC Code explanation	Commentary
		<p>shareholder has the option to fund pro rata or convert the remaining 5% into a royalty that can be bought out for US\$750,000.</p> <ul style="list-style-type: none"> Australian private company Iberian Critical Minerals Pty Ltd owns 100% of the issued capital of Omnis Minería SL. Osmond Resources has received shareholder approval to acquire all the issued capital of Iberian Critical Minerals Pty Ltd. Osmond Resources currently owns 80% of Iberian Critical Minerals Pty Ltd. Once the application has been officially submitted, the tenement is secured and no other entity can apply for the area The investigation and the potential mining exploitation activity should be adapted to be compatible preserving the natural values within the ZEC zones
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> The area was investigated for U and Th in the 1950s and 1960s by Junta de Energía Nuclear (JEN). JEN did not continue with its exploration given low levels of U and Th. Anomalous enrichment in heavy minerals was noted. In the 1980's, Dupont studied the area for heavy minerals but did not continue its exploration.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> The deposit can be considered as a lithified tidal sand bed-type deposit (placer), with various layers enriched in heavy minerals. Layer thickness ranges from 0.3 – 4.0m. The most significant minerals of economic importance are rutile, ilmenite, zircon and monazite. The primary rock type that hosts the mineralisation is weakly laminated quartzite. Stratigraphically the host rock is correlated with the Pochico Formation. Genesis: destruction and transport of granite-type materials rich in heavy minerals. Due to these minerals high density, they have been concentrated similar to a tidal sand-type deposits (placer).
Drill hole information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level—elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<ul style="list-style-type: none"> Drill hole information is tabulated in the body of this release. All drill holes were diamond cored. No information has been excluded.
Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. 	<ul style="list-style-type: none"> For diamond drilling, weighted average grade calculations were made as follows: <ul style="list-style-type: none"> Primary cut-off: 2% TiO₂, max. 0.9m internal dilution Secondary cut-off: 5% TiO₂, max. 0.6m internal dilution Ternary cut-off: 8% TiO₂, max. 0.3m internal dilution No maximum or minimum grade truncations were applied to the raw assay data. No metal equivalent values have been reported.

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> The assumptions used for any reporting of metal equivalent values should be clearly stated. 	
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known'). 	<ul style="list-style-type: none"> Drill holes are predominantly vertical (-90°) or near-vertical (-75°) so as to intersect the sub-horizontal stratigraphy at a perpendicular angle. Usual intersections between hole and bedding have been near to orthogonal. The true thickness of stratigraphy intersected is outlined in the body of this release.
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> Relevant maps and sections are contained in the body of this release.
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> All available relevant information is reported.
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples—size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> The main geological observation is the likely continuity of the primary heavy mineral layers undercover. This is important in the context of continuity of the high-grade layers and the possible scale associated with them. Importantly, rock chip and channel sample assay results indicate very low levels of deleterious elements.
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> Further planned work included geological mapping, rock chip sampling, channel sampling, geophysical studies, diamond drilling, metallurgical studies, product marketing and scoping studies. The Investigation Permits under application (Metioque, Menodice, Menipe) are areas where OSM will target lateral extensions to the prospective stratigraphy when these permits are granted.

1 APPENDIX 5B

1.1 Mining exploration entity or oil and gas exploration entity quarterly cash flow report

1.2 Name of entity

OSMOND RESOURCES LIMITED

1.3 ABN

96 649 477 734

1.4 1.5 Quarter ended ("current quarter")

31 DECEMBER 2025

1.6 Consolidated statement of cash flows	Current quarter \$A'000	Year to date (6 months) \$A'000
1. Cash flows from operating activities		
1.1 Receipts from customers		
1.2 Payments for		
(a) exploration & evaluation – including assessing new projects		(152)
(b) development		
(c) production		
(d) staff costs (not included in 2.1(d) or above)	(38)	(74)
(e) administration and corporate costs	(412)	(865)
1.3 Dividends received (see note 3)		
1.4 Interest received	19	75
1.5 Interest and other costs of finance paid		
1.6 Income taxes paid		
1.7 Government grants and tax incentives		
1.8 Other		
1.9 Net cash from / (used in) operating activities	(431)	(1,016)

2. Cash flows from investing activities		
2.1 Payments to acquire or for:		
(a) entities		
(b) tenements		(200)
(c) property, plant and equipment	(5)	(5)
(d) exploration & evaluation	(783)	(1,160)
(e) investments		
(f) other non-current assets		

1.6 Consolidated statement of cash flows		Current quarter \$A'000	Year to date (6 months) \$A'000
2.2	Proceeds from the disposal of: (a) entities (b) tenements (c) property, plant and equipment (d) investments (e) other non-current assets		
2.3	Cash flows from loans to other entities – Spain	(89)	(296)
2.4	Dividends received (see note 3)		
2.5	Other – Bank guarantee deposits - Consolidation of new subsidiaries		(127) 164
2.6	Net cash from / (used in) investing activities	(877)	(1,624)

3.	Cash flows from financing activities		
3.1	Proceeds from issues of equity securities (excluding convertible debt securities)		
3.2	Proceeds from issue of convertible debt securities		
3.3	Proceeds from exercise of options	580	708
3.4	Transaction costs related to issues of equity securities or convertible debt securities		
3.5	Proceeds from borrowings		
3.6	Repayment of borrowings		
3.7	Transaction costs related to loans and borrowings		
3.8	Dividends paid		
3.9	Other (provide details if material)		
3.10	Net cash from / (used in) financing activities	580	708

4.	Net increase / (decrease) in cash and cash equivalents for the period		
4.1	Cash and cash equivalents at beginning of period	3,095	4,299
4.2	Net cash from / (used in) operating activities (item 1.9 above)	(431)	(1,016)
4.3	Net cash from / (used in) investing activities (item 2.6 above)	(877)	(1,624)
4.4	Net cash from / (used in) financing activities (item 3.10 above)	580	708

1.6 Consolidated statement of cash flows		Current quarter \$A'000	Year to date (6 months) \$A'000
4.5	Effect of movement in exchange rates on cash held		
4.6	Cash and cash equivalents at end of period	2,367	2,367

5.	1.7 Reconciliation of cash and cash equivalents at the end of the quarter (as shown in the consolidated statement of cash flows) to the related items in the accounts	Current quarter \$A'000	Previous quarter \$A'000
5.1	Bank balances	580	229
5.2	Call deposits		
5.3	Bank overdrafts		
5.4	Other – short term deposits	1,787	2,866
5.5	Cash and cash equivalents at end of quarter (should equal item 4.6 above)	2,367	3,095

1.7.1

6.	1.8 Payments to related parties of the entity and their associates	Current quarter \$A'000
6.1	Aggregate amount of payments to related parties and their associates included in item 1	38
6.2	Aggregate amount of payments to related parties and their associates included in item 2	112
Payments in 6.1 and 6.2 relate to Director salaries.		
<i>Note: if any amounts are shown in items 6.1 or 6.2, your quarterly activity report must include a description of, and an explanation for, such payments.</i>		

7.	1.9 Financing facilities <i>Note: the term "facility" includes all forms of financing arrangements available to the entity.</i> 1.10 Add notes as necessary for an understanding of the sources of finance available to the entity.	Total facility amount at quarter end \$A'000	Amount drawn at quarter end \$A'000
7.1	Loan facilities		
7.2	Credit standby arrangements		
7.3	Other (please specify)		
7.4	Total financing facilities		
7.5	Unused financing facilities available at quarter end		
7.6	Include in the box below a description of each facility above, including the lender, interest rate, maturity date and whether it is secured or unsecured. If any additional financing facilities have been entered into or are proposed to be entered into after quarter end, include a note providing details of those facilities as well.		

8.	1.11 Estimated cash available for future operating activities	\$A'000
8.1	Net cash from / (used in) operating activities (item 1.9)	(431)
8.2	(Payments for exploration & evaluation classified as investing activities) (item 2.1(d))	(783)
8.3	Total relevant outgoings (item 8.1 + item 8.2)	(1,214)
8.4	Cash and cash equivalents at quarter end (item 4.6)	2,367
8.5	Unused finance facilities available at quarter end (item 7.5)	-
8.6	Total available funding (item 8.4 + item 8.5)	2,367
8.7	Estimated quarters of funding available (item 8.6 divided by item 8.3)	1.95
<i>Note: if the entity has reported positive relevant outgoings (ie a net cash inflow) in item 8.3, answer item 8.7 as "N/A". Otherwise, a figure for the estimated quarters of funding available must be included in item 8.7.</i>		
8.8	If item 8.7 is less than 2 quarters, please provide answers to the following questions:	
8.8.1	Does the entity expect that it will continue to have the current level of net operating cash flows for the time being and, if not, why not?	
Answer: The Company raised A\$6.6m in early January 2026 for a Pro Forma Cash at Bank position as at 31 December 2025 of over A\$8.5m inclusive of the placement.		
8.8.2	Has the entity taken any steps, or does it propose to take any steps, to raise further cash to fund its operations and, if so, what are those steps and how likely does it believe that they will be successful?	
Answer: Refer above.		

8.8.3 Does the entity expect to be able to continue its operations and to meet its business objectives and, if so, on what basis?

Answer: Refer above

Note: where item 8.7 is less than 2 quarters, all of questions 8.8.1, 8.8.2 and 8.8.3 above must be answered.

1.12 Compliance statement

- 1 This statement has been prepared in accordance with accounting standards and policies which comply with Listing Rule 19.11A.
- 2 This statement gives a true and fair view of the matters disclosed.

Date: 29 January 2026

Authorised by: The Board
(Name of body or officer authorising release – see note 4)

1.13 Notes

1. This quarterly cash flow report and the accompanying activity report provide a basis for informing the market about the entity's activities for the past quarter, how they have been financed and the effect this has had on its cash position. An entity that wishes to disclose additional information over and above the minimum required under the Listing Rules is encouraged to do so.
2. If this quarterly cash flow report has been prepared in accordance with Australian Accounting Standards, the definitions in, and provisions of, *AASB 6: Exploration for and Evaluation of Mineral Resources* and *AASB 107: Statement of Cash Flows* apply to this report. If this quarterly cash flow report has been prepared in accordance with other accounting standards agreed by ASX pursuant to Listing Rule 19.11A, the corresponding equivalent standards apply to this report.
3. Dividends received may be classified either as cash flows from operating activities or cash flows from investing activities, depending on the accounting policy of the entity.
4. If this report has been authorised for release to the market by your board of directors, you can insert here: "By the board". If it has been authorised for release to the market by a committee of your board of directors, you can insert here: "By the [*name of board committee – eg Audit and Risk Committee*]". If it has been authorised for release to the market by a disclosure committee, you can insert here: "By the Disclosure Committee".
5. If this report has been authorised for release to the market by your board of directors and you wish to hold yourself out as complying with recommendation 4.2 of the ASX Corporate Governance Council's *Corporate Governance Principles and Recommendations*, the board should have received a declaration from its CEO and CFO that, in their opinion, the financial records of the entity have been properly maintained, that this report complies with the appropriate accounting standards and gives a true and fair view of the cash flows of the entity, and that their opinion has been formed on the basis of a sound system of risk management and internal control which is operating effectively.
